The following document contains information on Cypress products. Although the document is marked with the name "Spansion" and "Fujitsu", the company that originally developed the specification, Cypress will continue to offer these products to new and existing customers.

Continuity of Specifications
There is no change to this document as a result of offering the device as a Cypress product. Any changes that have been made are the result of normal document improvements and are noted in the document history page, where supported. Future revisions will occur when appropriate, and changes will be noted in a document history page.

Continuity of Ordering Part Numbers
Cypress continues to support existing part numbers. To order these products, please use only the Ordering Part Numbers listed in this document.

For More Information
Please contact your local sales office for additional information about Cypress products and solutions.

About Cypress
Cypress (NASDAQ: CY) delivers high-performance, high-quality solutions at the heart of today's most advanced embedded systems, from automotive, industrial and networking platforms to highly interactive consumer and mobile devices. With a broad, differentiated product portfolio that includes NOR flash memories, F-RAM™ and SRAM, Traveo™ microcontrollers, the industry's only PSoC® programmable system-on-chip solutions, analog and PMIC Power Management ICs, CapSense® capacitive touch-sensing controllers, and Wireless BLE Bluetooth® Low-Energy and USB connectivity solutions, Cypress is committed to providing its customers worldwide with consistent innovation, best-in-class support and exceptional system value.

16-Bit Original Microcontroller

CMOS

F²MC-16LX MB90420G/425G Series

MB90423GA/423GC/F423GA/F423GC/427GA/427GC/428GA/428GC/ MB90F428GA/F428GC/V420G

■ DESCRIPTIONS

The FUJITSU MICROELECTRONICS MB90420G/425G Series is a 16-bit general purpose high-capacity micro-controller designed for vehicle meter control applications etc.

The instruction set retains the same AT architecture as the FUJITSU MICROELECTRONICS original F²MC-8L and F²MC-16L series, with further refinements including high-level language instructions, expanded addressing mode, enhanced (signed) multipler-divider computation and bit processing.

In addition, a 32-bit accumulator is built in to enable long word processing.

■ FEATURES

- 16-bit input capture (4 channels)
  Detects rising, falling, or both edges.
  16-bit capture register × 4
  Pin input edge detection latches the 16-bit free-run timer counter value, and generates an interrupt request.
- 16-bit reload timer (2 channels)
  16-bit reload timer operation (select toggle output or one-shot output)
  Event count function selection provided
- Watch timer (main clock)
  Operates directly from oscillator clock.
  Compensates for oscillator deviation
  Read/write enabled second/minute/hour register
  Signal interrupt

The information for microcontroller supports is shown in the following homepage.
Be sure to refer to the "Check Sheet" for the latest cautions on development.

"Check Sheet" is seen at the following support page

"Check Sheet" lists the minimal requirement items to be checked to prevent problems beforehand in system development.

http://edevice.fujitsu.com/micom/en-support/

FUJITSU

- 16-bit PPG (3 channels)
  Output pins (3) , external trigger input pin (1)
  Output clock frequencies : f_{CP}, $f_{CP}/2^2$, $f_{CP}/2^4$, $f_{CP}/2^6$
- Delay interrupt
  Generates interrupt for task switching.
  Interruptions to CPU can be generated/deleted by software setting.
- External interrupts (8 channels)
  8-channel independent operation
  Interrupt source setting available : "L" to "H" edge/ "H" to "L" edge/ "L" level/ "H" level.
- A/D converter
  10-bit or 8-bit resolution × 8 channels (input multiplexed)
  Conversion time : 6.13 μs or less (at f_{CP} = 16 MHz)
  External trigger startup available (P50/INT0/ADTG)
  Internal timer startup available (16-bit reload timer 1)
- UART (2 channels)
  Full duplex double buffer type
  Supports asynchronous/synchronous transfer (with start/stop bits)
  Internal timer can be selected as clock (16-bit reload timer 0)
  Asynchronous : 4808 bps, 5208 bps, 9615 bps, 10417 bps, 19230 bps, 38460 bps, 62500 bps, 500000 bps
  Synchronous : 500 Kbps, 1Mbps, 2Mbps (at f_{CP} = 16 MHz)
- CAN interface [1]
  Conforms to CAN specifications version 2.0 Part A and B.
  Automatic resend in case of error.
  Automatic transfer in response to remote frame.
  16 prioritized message buffers for data and messages for data and ID
  Multiple message support
  Receiving filter has flexible configuration : All bit compare/all bit mask/two partial bit masks
  Supports up to 1 Mbps
  CAN WAKEUP function (connects RX internally to INT0)
- LCD controller/driver (1 channel)
  Segment driver and command driver with direct LCD panel (display) drive capability
- Low voltage/Program Looping detect reset [2]
  Automatic reset when low voltage is detected
  Program Looping detection function
- Stepping motor controller (4 channels)
  High current output for all channels × 4
  Synchronized 8/10-bit PWM for all channels × 2
- Sound generator
  8-bit PWM signal mixed with tone frequency from 8-bit reload counter.
  PWM frequencies : 62.5 kHz, 31.2 kHz, 15.6 kHz, 7.8 kHz (at f_{CP} = 16MHz)
  Tone frequencies : 1/2 PWM frequency, divided by (reload frequency +1)
- Input/output ports
  Push-pull output and Schmitt trigger input
  Programmable in bit units for input/output or peripheral signals.

■ PIN DESCRIPTIONS

Pin no.		Symbol	Circuit type	Description
LQFP	QFP			
80	82	X0	A	High speed oscillator input pin.
81	83	X1		High speed oscillator output pin.
78	80	X0A	A	Low speed oscillator input pin. If no oscillator is connected, apply pull-down processing.
77	79	X1A		Low speed oscillator output pin. If no oscillator is connected, leave open.
75	77	$\overline{\text{RST}}$	B	Reset input pin.
83	85	P00	G	General purpose input/output port.
		SIN0		UART ch.0 serial data input pin.
		INT4		INT4 external interrupt input pin.
84	86	P01	G	General purpose input/output port.
		SOT0		UART ch.0 serial data output pin.
		INT5		INT5 external interrupt input pin.
85	87	P02	G	General purpose input/output port.
		SCK0		UART ch.0 serial clock input/output pin.
		INT6		INT6 external interrupt input pin.
86	88	P03	G	General purpose input/output port.
		SIN1		UART ch.1 serial data input pin.
		INT7		INT7 external interrupt input pin.
87	89	P04	G	General purpose input/output port.
		SOT1		UART ch.1 serial data output pin.
88	90	P05	G	General purpose input/output port.
		SCK1		UART ch.1 serial clock input/output pin.
		TRG		16-bit PPG ch.0-2 external trigger input pin.
89	91	P06	G	General purpose input/output port.
		PPG0		16-bit PPG ch.0 output pin.
		TOT1		16-bit reload timer ch.1 TOT output pin.
90	92	P07	G	General purpose input/output port.
		PPG1		16-bit PPG ch.1 output pin.
		TIN1		16-bit reload timer ch.1 TIN output pin.
91	93	P10	G	General purpose input/output port.
		PPG2		16-bit PPG ch.2 output pin.

(Continued)

Pin no.		Symbol	Circuit type	Description
LQFP	QFP			
92	94	P11	G	General purpose input/output port.
		TOT0		16-bit reload timer ch.0 TOT output pin.
		WOT		Real-time watch timer WOT output pin.
93	95	P12	G	General purpose input/output port.
		TIN0		16-bit reload timer ch.0 TIN output pin.
		IN3		Input capture ch.3 trigger input pin.
94 to 96	96 to 98	P13 to P15	G	General purpose input/output ports.
		IN2 to IN0		Input capture ch.0-2 trigger input pins.
97 to 100	99 to 100, 1 to 2	COM0 to COM3	I	LCD controller/driver common output pins.
1 to 8, 10 to 13	3 to 10, 12 to 15	SEG0 to SEG11	I	LCD controller/driver segment output pins.
14 to 15	16 to 17	P36 to P37	E	General purpose output ports.
		SEG12 to SEG13		LCD controller/driver segment output pins.
16 to 20, 22 to 24	18 to 22, 24 to 26	P40 to P47	E	General purpose input output ports.
		SEG14 to SEG21		LCD controller/driver segment output pins.
26, 27	28, 29	P90, P91	E	General purpose input output ports.
		SEG22, SEG23		LCD controller/driver segment output pins.
34	36	P50	G	General purpose input output ports.
		INT0		INT0 external interrupt input pin.
		ADTG		A/D converter external trigger input pin.
36 to 39, 41 to 44	38 to 41, 43 to 46	P60 to P67	F	General purpose input output ports.
		AN0 to AN7		A/D converter input pins.
45	47	P51	G	General purpose input output port.
		INT1		INT1 external interrupt input pin.
		(RX1 *[1])		CAN interface 1 RX intput pin.
46	48	P52	G	General purpose input output port.
		INT2		INT2 external interrupt input pin.
		(TX1 *[1])		CAN interface 1 TX output pin.
50	52	P53	G	General purpose input output port.
		INT3		INT3 external interrupt input pin.

H	High current Hysteresis input	• CMOS high current output • Hysteresis input
I	LCDC output	• LCDC output

FUJITSU

■ HANDLING DEVICES

Precautions for Handling Semiconductor Devices

  • Strictly observe maximum rated voltages (prevent latchup)

When CMOS integrated circuit devices are subjected to applied voltages higher than Vcc at input and output pins other than medium- and high-withstand voltage pins, or to voltages lower than Vss, or when voltages in excess of rated levels are applied between Vcc and Vss, a phenomenon known as latchup can occur. In a latchup condition, supply current can increase dramatically and may destroy semiconductor elements. In using semiconductor devices, always take sufficient care to avoid exceeding maximum ratings.

Also care must be taken when power to analog systems is switched on or off, to ensure that the analog power supply (AVcc, AVRH) , analog input and dedicated power supply for the high current output buffer pins (DVcc) do not exceed the digital power supply (Vcc) .

Once the digital power supply (Vcc) is switched on, the analog power (AVcc,AVRH) and dedicated power supply for the high current output buffer pins (DVcc) may be turned on in any sequence.

  • Stable supply voltage

Even within the warranted operating range of Vcc supply voltage, sudden fluctuations in supply voltage can cause abnormal operation. The recommended stability for ripple fluctuations (P-P values) at commercial frequencies (50 Hz to 60 Hz) should be within 10% of the standard Vcc value, and voltage fluctuations that occur during switching of power supplies etc. should be limited to transient fluctuation rates of 0.1 V/ms or less.

  • Power-on procedures

In order to prevent abnormal operation of the internal built-in step-down circuits, voltage rise time during power-on should be attained within 50 μs (0.2 V to 2.7 V) .

  • Treatment of unused pins

If unused input pins are left open, they may cause abnormal operation or latchup which may lead to permanent damage to the semiconductor. Any such pins should be pulled up or pulled down through resistance of at least 2 kΩ.

Any unused input/output pins should be left open in output status, or if found set to input status, they should be treated in the same way as input pins.

Any unused output pins should be left open.

  • Treatment of A/D converter power supply pins

Even if the A/D converter is not used, pins should be connected so that AVcc = Vcc, and AVss = AVRH = Vss.

  • Use of external clock signals

Even when an external clock is used, a stabilization period is required following a power-on reset or release from sub clock mode or stop mode. Also, when an external clock is used it should drive only the X0 pin and the X1 pin should be left open, as shown in the following figure.

Sample external clock connection
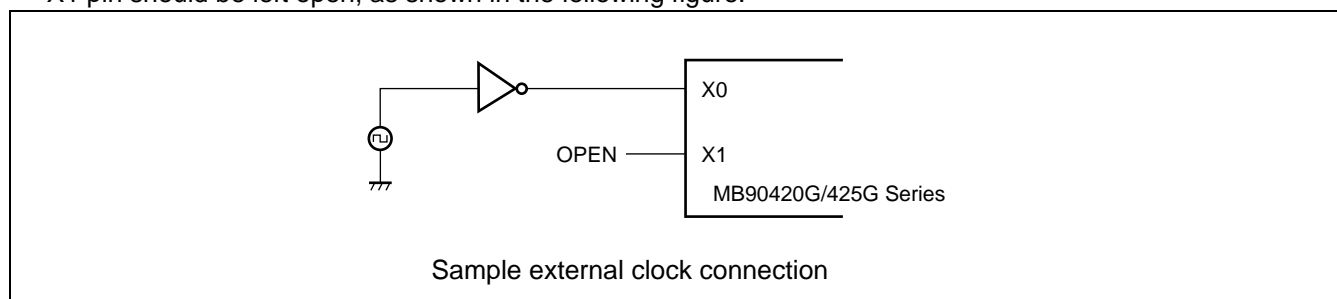

• **Power supply pins**

Devices are designed to prevent problems such as latchup when multiple Vcc and Vss supply pins are used, by providing internal connections between pins having the same potential. However, in order to reduce unwanted radiation, and to prevent abnormal operation of strobe signals due to rise in ground level, and to maintain total output current ratings, all such pins should always be connected externally to power supplies and ground.

As shown in figure below, all Vcc power supply pins must have the same potential. All Vss power supply pins should be handled in the same way. If there are multiple Vcc or Vss systems, the device will not operate properly even within the warranted operating range.

Power supply input pins (Vcc/Vss)
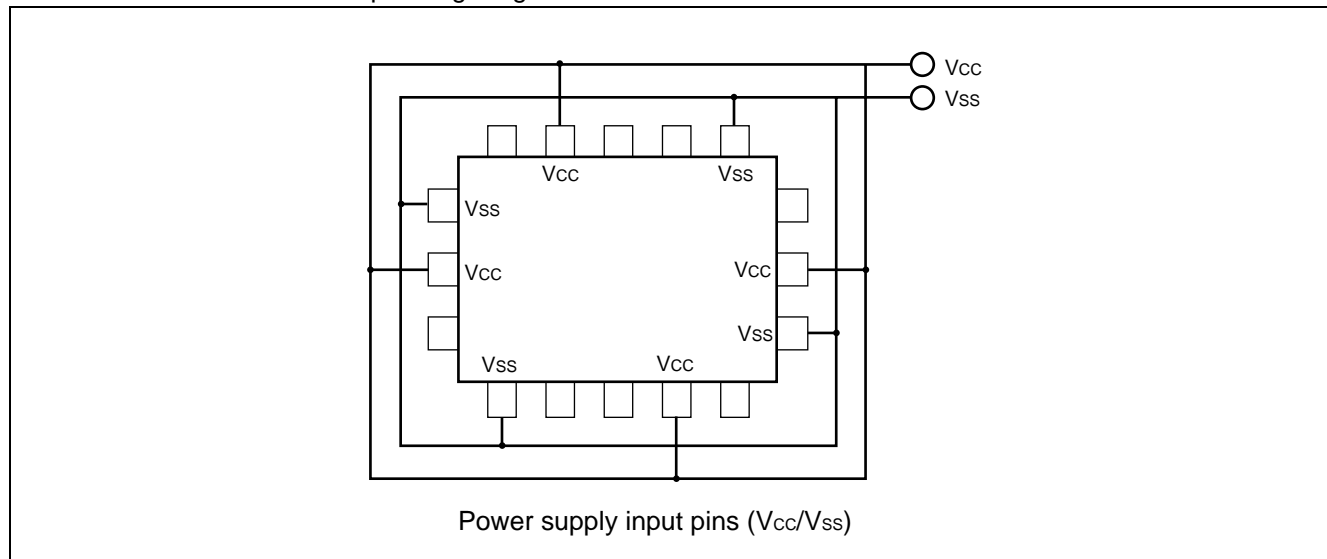

In addition, care must be given to connecting the Vcc and Vss pins of this device to a current source with as little impedance as possible. It is recommended that a bypass capacitor of 1.0 µF be connected between Vcc and Vss as close to the pins as possible.

• **Proper sequence of A/D converter power supply analog input**

A/D converter power (AVcc, AVRH) and analog input (AN0-AN7) must be applied after the digital power supply (Vcc) is switched on. When power is shut off, the A/D converter power supply and analog input must be cut off before the digital power supply is switched on (Vcc) . In both power-on and shut-off, care should be taken that AVRH does not exceed AVcc. Even when pins which double as analog input pins are used as input ports, be sure that the input voltage does not exceed AVcc. (There is no problem if analog power supplies and digital power supplies are turned off and on at the same time.)

• **Handling the power supply for high-current output buffer pins (DVcc, DVss)**

Always apply power to high-current output buffer pins (DVcc, DVss) after the digital power supply (Vcc) is turned on. Also when switching power off, always shut off the power supply to the high-current output buffer pins (DVcc, DVss) before switching off the digital power supply (Vcc) . (There will be no problem if high-current output buffer pins and digital power supplies are turned off and on at the same time.)

Even when high-current output buffer pins are used as general purpose ports, the power for high current output buffer pins (DVcc, DVss) should be applied to these pins.

• **Pull-up/pull-down resistance**

The MB90420G/425G series does not support internal pull-up/pull-down resistance. If necessary, use external components.

• **Precautions for when not using a sub clock signal.**

If the X0A and X1A pins are not connected to an oscillator, apply pull-down treatment to the X0A pin and leave the X1A pin open.

• **Notes on during operation of PLL clock mode**

If the PLL clock mode is selected, the microcontroller attempt to be working with the self-oscillating circuit even when there is no external oscillator or external clock input is stopped. Performance of this operation, however, cannot be guaranteed.
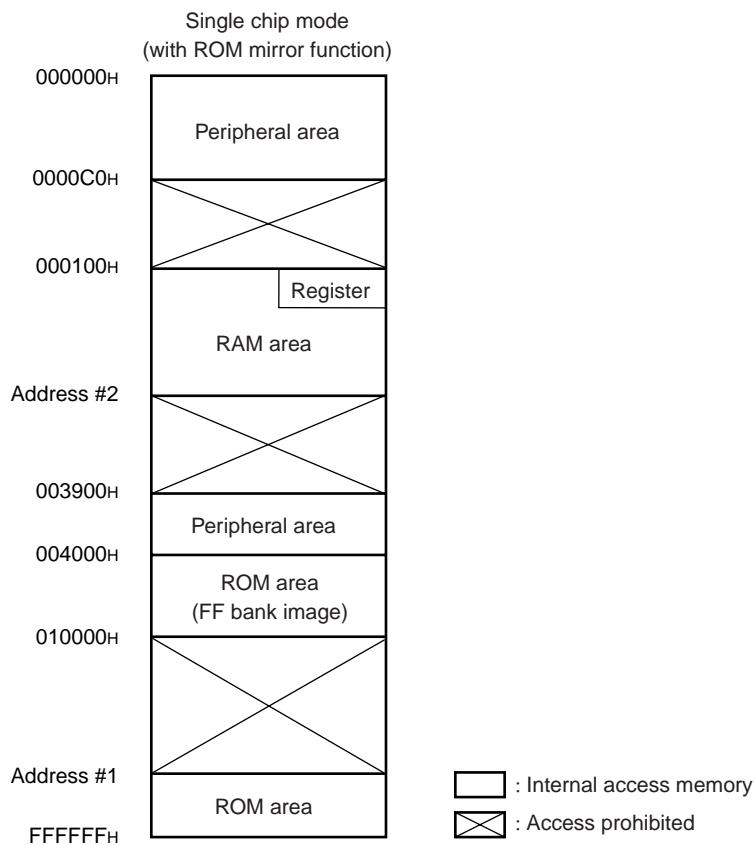

■ BLOCK DIAGRAM
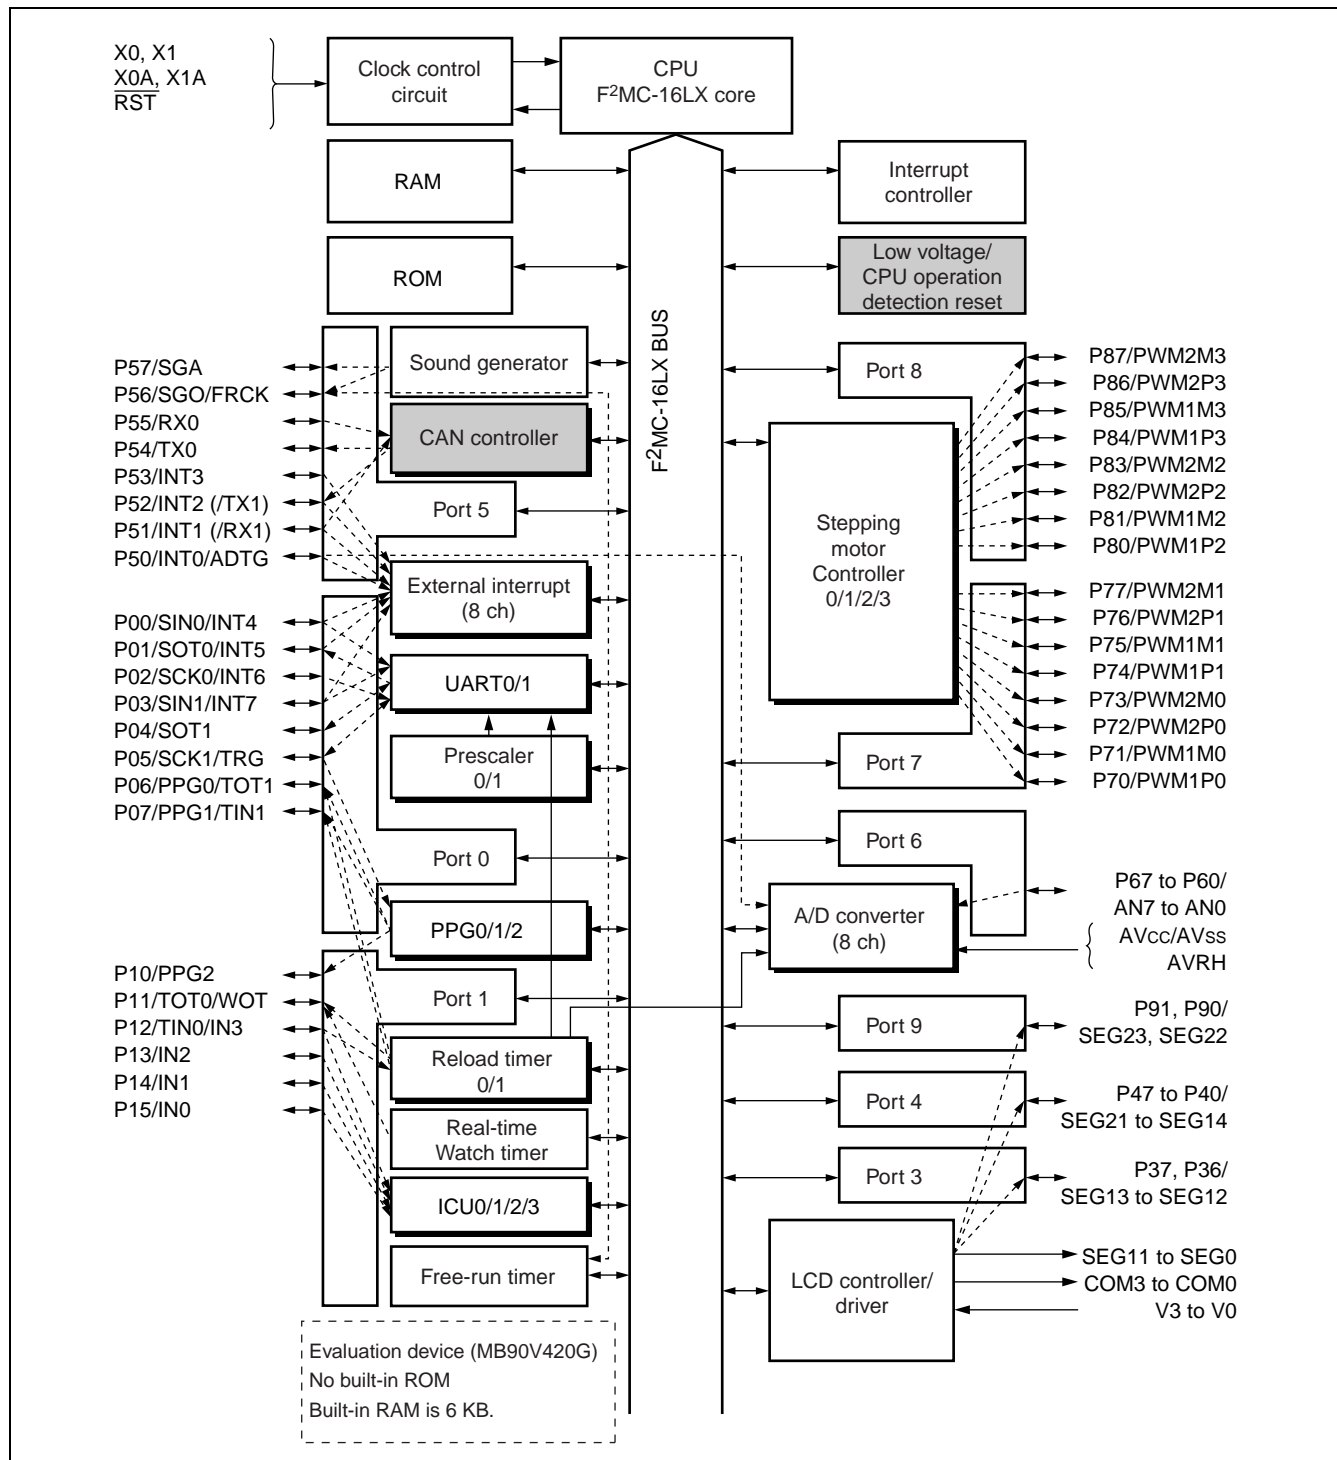

Note: MB90420G series is equipped with 2-channel CAN interface and MB90425G series is equipped with 1-channel CAN interface. MB90F423GA, MB90423GA, MB90F428GA, MB90427GA and MB90428GA have low voltage/CPU operation detection reset. MB90F423GC, MB90423GC, MB90F428GC, MB90427GC, MB90428GC and MB90V420G do not have low voltage/CPU operation detection reset.
See "■ Product Lineup" for detail.

⊠ : Access prohibited

Parts No.	Address #1	Address #2
MB90423GA/GC	FE0000H	001900H
MB90427GA/GC	FF0000H	001100H
MB90428GA/GC	FE0000H	001900H
MB90F423GA/GC	FE0000H	001900H
MB90F428GA/GC	FE0000H	001900H
MB90V420G	FE0000H	001900H

Note : To select models without the ROM mirror function, see the "ROM Mirror Function Selection Module." The image of the ROM data in the FF bank appears at the top of the 00 bank, in order to enable efficient use of small C compiler models. The lower 16-bit address for the FF bank will be assigned to the same address, so that tables in ROM can be referenced without declaring a "far" indication with the pointer. For example when accessing the address 00C000H, the actual access is to address FFC000H in ROM. Here the FF bank ROM area exceeds 48 KB, so that it is not possible to see the entire area in the 00 bank image. Therefore because the ROM data from FF4000H to FFFFFFH will appear in the image from 004000H to 00FFFFH, it is recommended that the ROM data table be stored in the area from FF4000H to FFFFFFH.

- Initial value symbols :
  "0" initial value 0.
  "1" initial value 1.
  "X" initial value undetermined
  "-" initial value undetermined (none)
- Write/read symbols :
  "R/W" read/write enabled
  "R" read only
  "W" write only
- Addresses in the area 0000H to 00FFH are reserved for the principal functions of the MCU. Read access attempts to reserved areas will result in an "X" value. Also, write access to reserved areas is prohibited.

◎ : Compatible, with EI^{2}OS stop function
○ : Compatible
△ : Compatible when interrupt sources sharing ICR are not in use
× : Not compatible

*1 : • Peripheral functions sharing the ICR register have the same interrupt level.
　　• If peripheral functions sharing the ICR register are using expanded intelligent I/O services, one or the other
　　　cannot be used.
　　• When peripheral functions are sharing the ICR register and one specifies expanded intelligent I/O services,
　　　the interrupt from the other function cannot be used.

*2 : 　Priority applies when interrupts of the same level are generated.

■ PERIPHERAL FUNCTIONS

1. I/O Ports

The I/O ports function is to send data from the CPU to be output from I/O pins and load input signals at the I/O pins into the CPU, according to the port data register (PDR) . Port input/output at I/O pins can be controlled in bit units by the port direction register (DDR) as required. The following list shows each of the functions as well as the shared peripheral function for each port.

- Port 0 : General purpose I/O port, shared with peripheral functions (external interrupt/UART/PPG)
- Port 1 : General purpose I/O port, shared with peripheral functions (PPG/reload timer/watch timer/ICU)
- Port 3 : General purpose I/O port, shared with peripheral functions (LCD)
- Port 4 : General purpose I/O port, shared with peripheral functions (LCD)
- Port 5 : General purpose I/O port, shared with peripheral functions (External interrupt/CAN/SG)
- Port 6 : General purpose I/O port, shared with peripheral functions (A/D converter)
- Port 7 : General purpose I/O port, shared with peripheral functions (Stepping motor controller)
- Port 8 : General purpose I/O port, shared with peripheral functions (Stepping motor controller)
- Port 9 : General purpose I/O port, shared with peripheral functions (LCD)

*: Range of input voltage.
 For ratings see "3. DC Characteristics" in "■ ELECTRICAL CHARACTERISTICS".

Note : Port 6 also functions as an analog input pin. When using this port as a general purpose port, always write
 "0" to the corresponding analog input enable register (ADER) bit. The ADER bit is initialized to "1" at reset.

Port 6
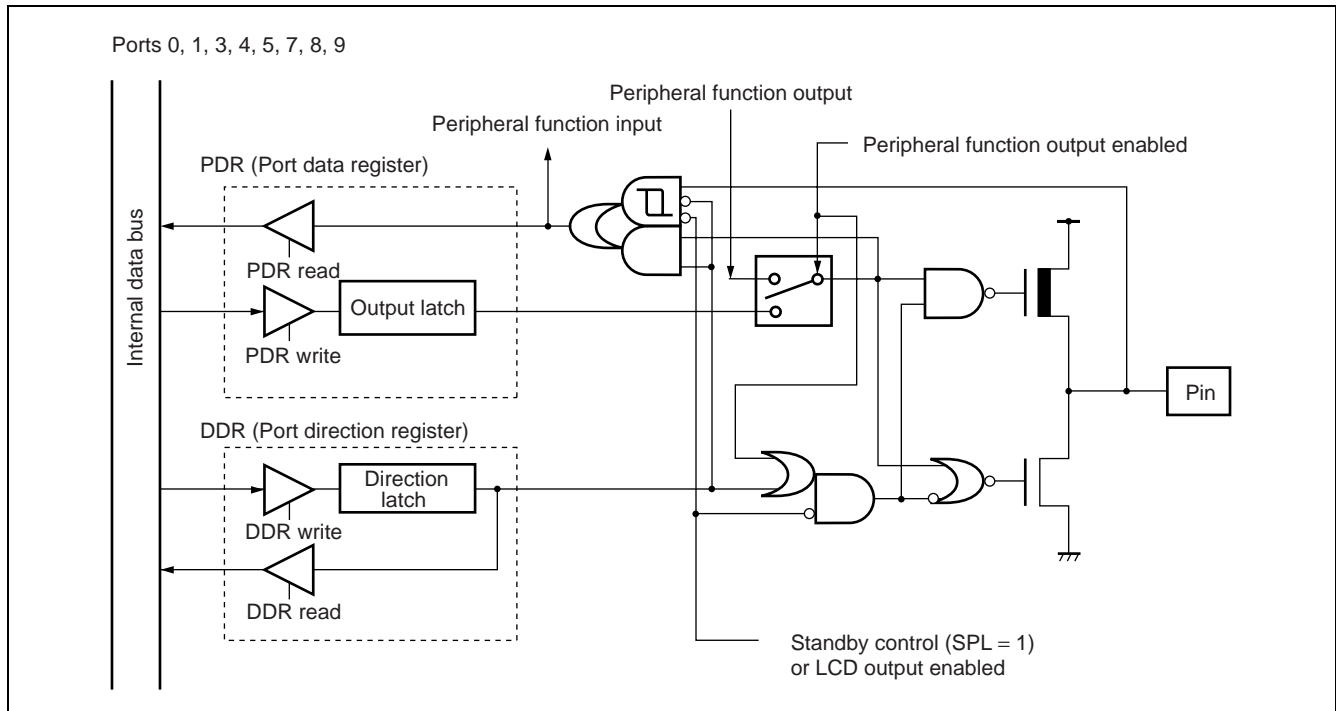

2. Watchdog Timer/Time Base Timer/Watch Timer

The watchdog timer, timer base timer, and watch timer have the following circuit configuration.

- Watchdog timer : Watchdog counter, control register, watchdog reset circuit
- Time base timer : 18-bit timer, interval interrupt control circuit
- Watch timer : 15-bit timer, interval interrupt control circuit

(1) Watchdog timer function

The watchdog timer is composed of a 2-bit watchdog counter that uses the carry signal from the 18-bit time base timer or 15-bit watch timer as a clock source, plus a control register and watchdog reset control circuit.

After startup, this function will reset the CPU if not cleared within a given time.

(2) Time base timer function

The time base timer is an 18-bit free-run counter (time base counter) synchronized with the internal count clock (base oscillator divided by 2) , with an interval timer function providing a selection of four interval times. Other functions include a timer output for an oscillator stabilization wait time and clock feed to the watchdog timer or other operating clocks. Note that the time base timer uses the main clock regardless of the setting of the MCS bit or SCS bit in the CKSCR register.

(3) Watch timer function

The watch timer provides functions including a clock source for the watchdog timer, a sub clock base oscillator stabilization wait timer, and an interval timer to generate an interrupt at fixed intervals. Note that the watch timer uses the sub clock regardless of the setting of the MCS bit or SCS bit in the CKSCR register.

• Block Diagram
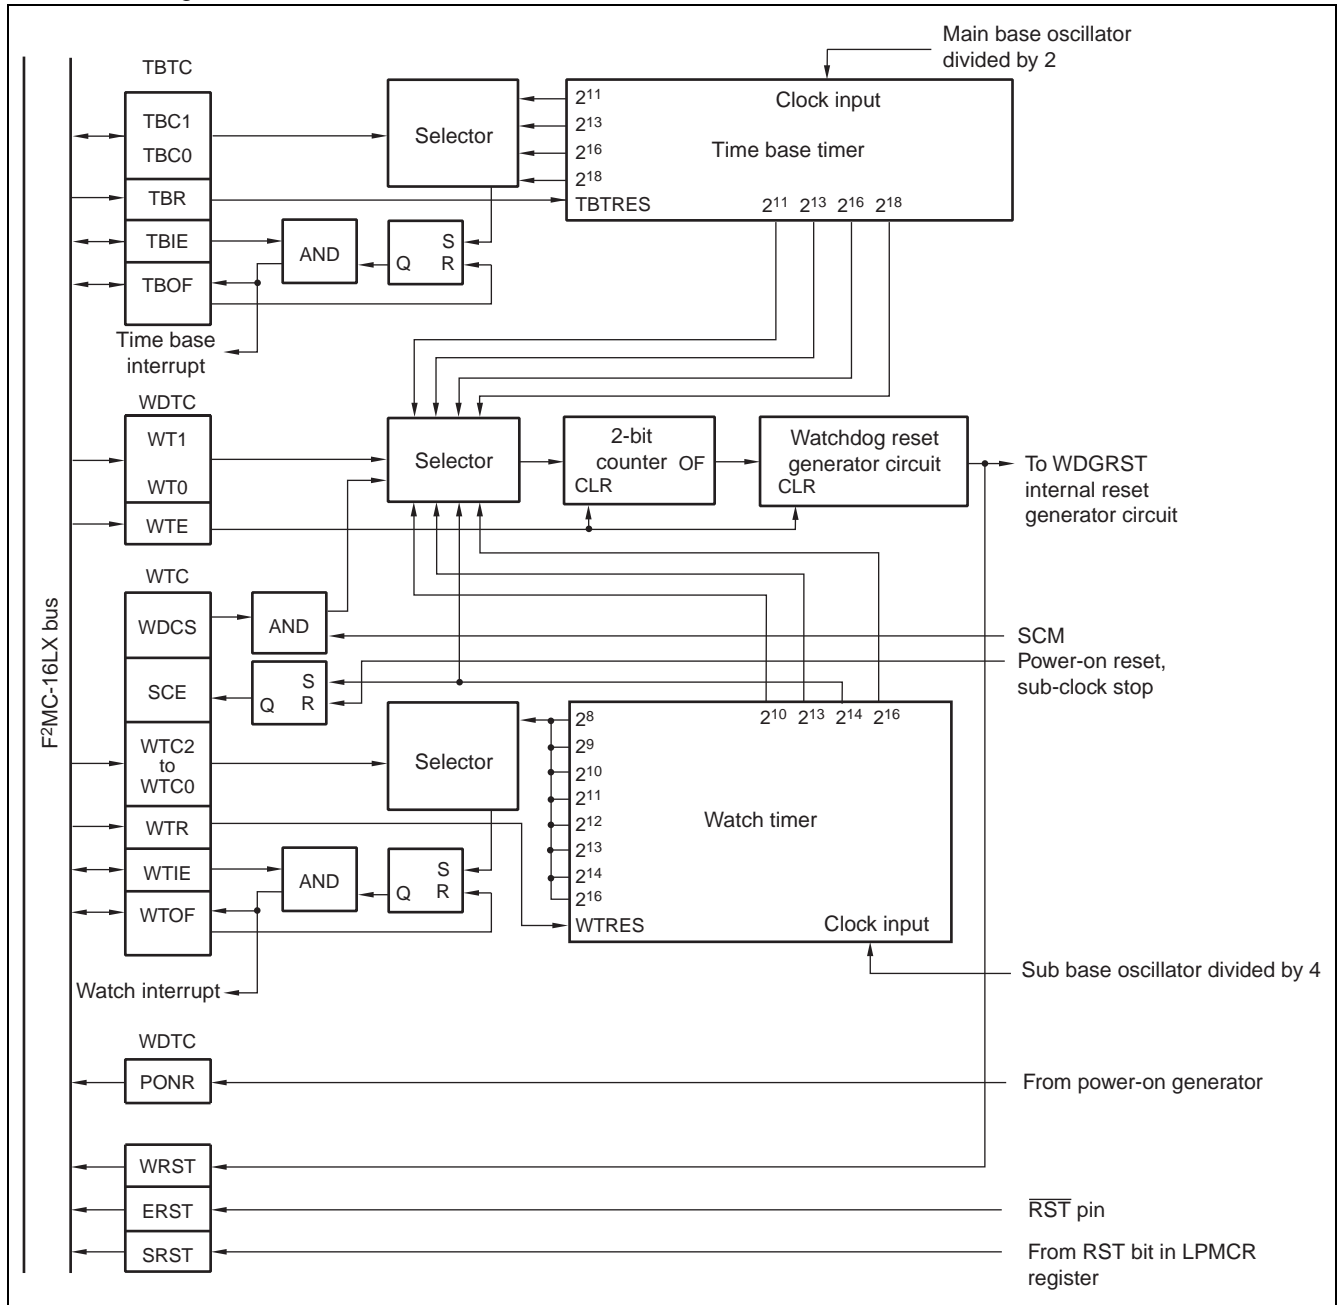

3. Input Capture

This circuit is composed of a 16-bit free-run timer and four 16-bit input capture circuits.

(1) Input capture (× 4)

The input capture circuits consist of four independent external input pins and corresponding capture registers and control registers. When the specified edge of the external signal input (at the input pin) is detected, the value of the 16-bit free-run timer is saved in the capture register, and at the same time an interrupt can also be generated.
• The valid edge (rising edge, falling edge, both edges) of the external signal can be selected.
• The four input capture circuits can operate independently.
• The interrupt can be generated from the valid edge of the external input signal.

(2) 16-bit free-run timer (× 1)

The 16-bit free-run timer is composed of a 16-bit up-counter, control register, 16-bit compare register, and prescaler. The output values from this counter are used as the base time for the input capture circuits.
• The counter clock operation can be selected from 8 options. The eight internal clock settings are ϕ, $\phi/2$, $\phi/4$, $\phi/8$, $\phi/16$, $\phi/32$, $\phi/64$, $\phi/128$ where ϕ represents the machine clock cycle.
• Interrupts can be generated from overflow events, or from compare match events with the compare register. (Compare match operation requires a mode setting.)
• The counter value can be initialized to "0000$_H$" by a reset, soft clear, or a compare match with the compare register.

(3) Block diagram

FUJITSU
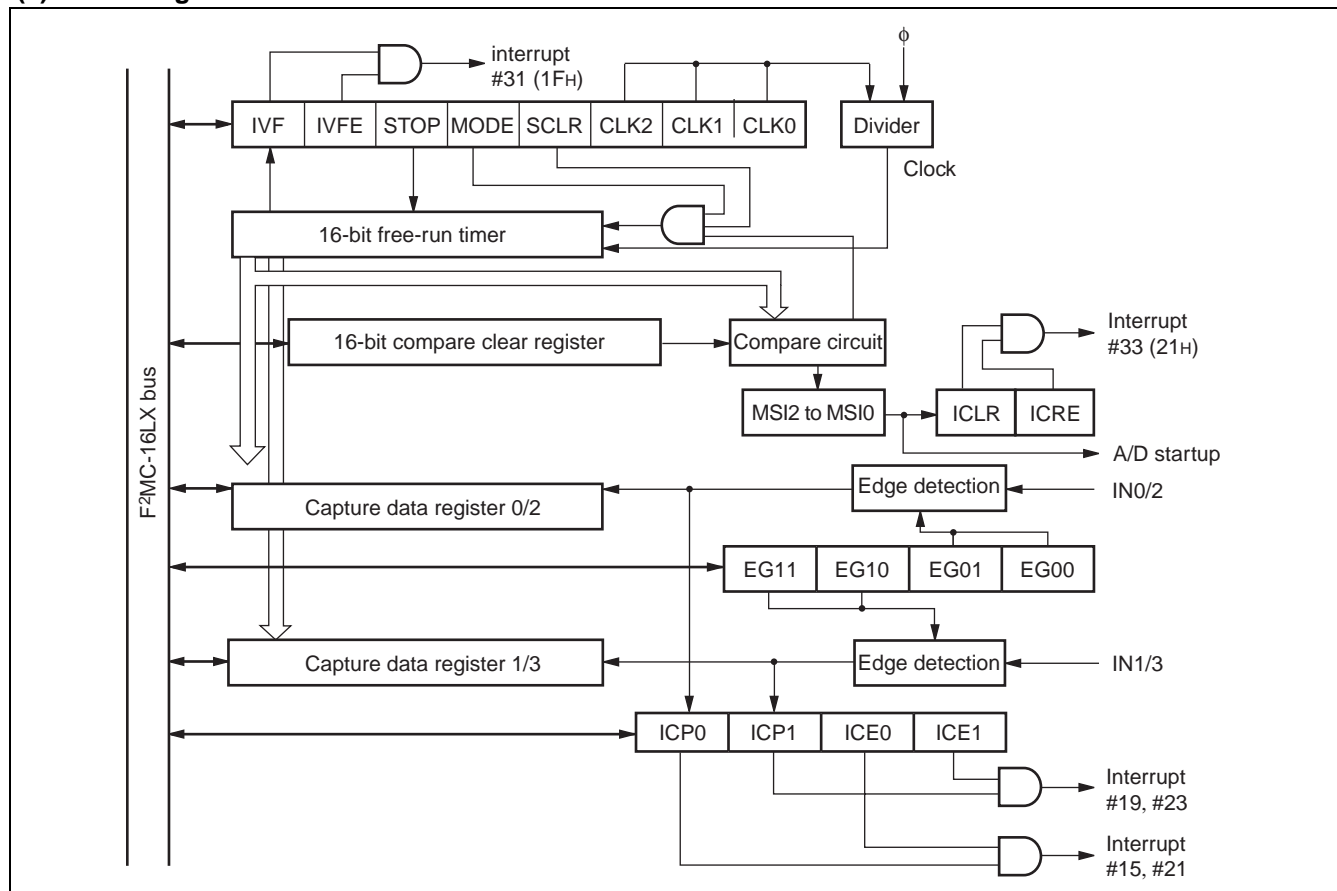

4. 16-bit Reload Timer

The 16-bit reload timer can either count down in synchronization with three types of internal clock signals in internal clock mode, or count down at the detection of the designated edge of an external signal. The user may select either function. This timer defines a transition from 0000$_H$ to FFFF$_H$ as an underflow event. Thus an underflow occurs when counting from the value [Reload register setting + 1].

A selection of two counter operating modes are available. In reload mode, the counter is reset to the count value and continues counting after an underflow, and in one-shot mode the count stops after an underflow. The counter can generate an interrupt when an underflow occurs, and is compatible with the expanded intelligent I/O services (EI^{2}OS) .

(1) 16-bit Reload timer operating modes

Clock mode	Counter mode	16-bit reload timer operation
Internal clock mode	Reload mode	Soft trigger operation External trigger operation External gate input operation
Internal clock mode	One-shot mode	Soft trigger operation External trigger operation External gate input operation
Event count mode (external clock mode)	Reload mode	Soft trigger operation
Event count mode (external clock mode)	One-shot mode	Soft trigger operation

(2) Internal clock mode

One of three input clocks is selected as the count clock, and can be used in one of the following operations.
- Soft trigger operation
  When "1" is written to the TRG bit in the timer control status register (TMCSR0/1) , the count operation starts.Trigger input at the TRG bit is normally valid with an external trigger input, as well as an external gate input.
- External trigger operation
  Count operation starts when a selected edge (rising, falling, both edges) is input at the TIN0/1 pin.
- External gate input operation
  Counting continues as long as the selected signal level ("L" or "H") is input at the TIN0/1 pin.

(3) Event count mode (External clock mode)

In this mode a down count event occurs when a selected valid edge (rising, falling, both edges) is input at the TIN0/1 pin. This function can also be used as an interval timer when an external clock with a fixed period is used.

(4) Counter operation
- Reload mode

In down count operation, when an underflow event (transition from "0000$_H$" to "FFFF$_H$") occurs, the set count value is reloaded and count operation continues. The function can be used as an interval timer by generating an interrupt request at each underflow event. Also, a toggle waveform that inverts at each underflow can be output from the TOT0/1 pin.

Counter clock	Counter clock period	Interval time
Internal clock	$2^1/\phi$ (0.125 µs)	0.125 µs to 8.192 ms
Internal clock	$2^3/\phi$ (0.5 µs)	0.5 µs to 32.768 ms
Internal clock	$2^5/\phi$ (2.0 µs)	2.0 µs to 131.1 ms
External clock	$2^3/\phi$ or greater (0.5 µs)	0.5 µs or greater

ϕ : Machine clock cycle. Figures in ( ) are values at machine clock frequency 16 MHz.

(5) One-shot mode

In down count operation, the count stops when an underflow event (transition from "0000$_H$" to "FFFF$_H$") occurs. This function can generate an interrupt at each underflow. While the counter is operating, a rectangular wave form indicating that the count is in progress can be output form the TOT0 and TOT1 pins.

(6) Block diagram

*1: Channel 0 and channel 1. Figures in < > are for channel 1.
*2: Interrupt number
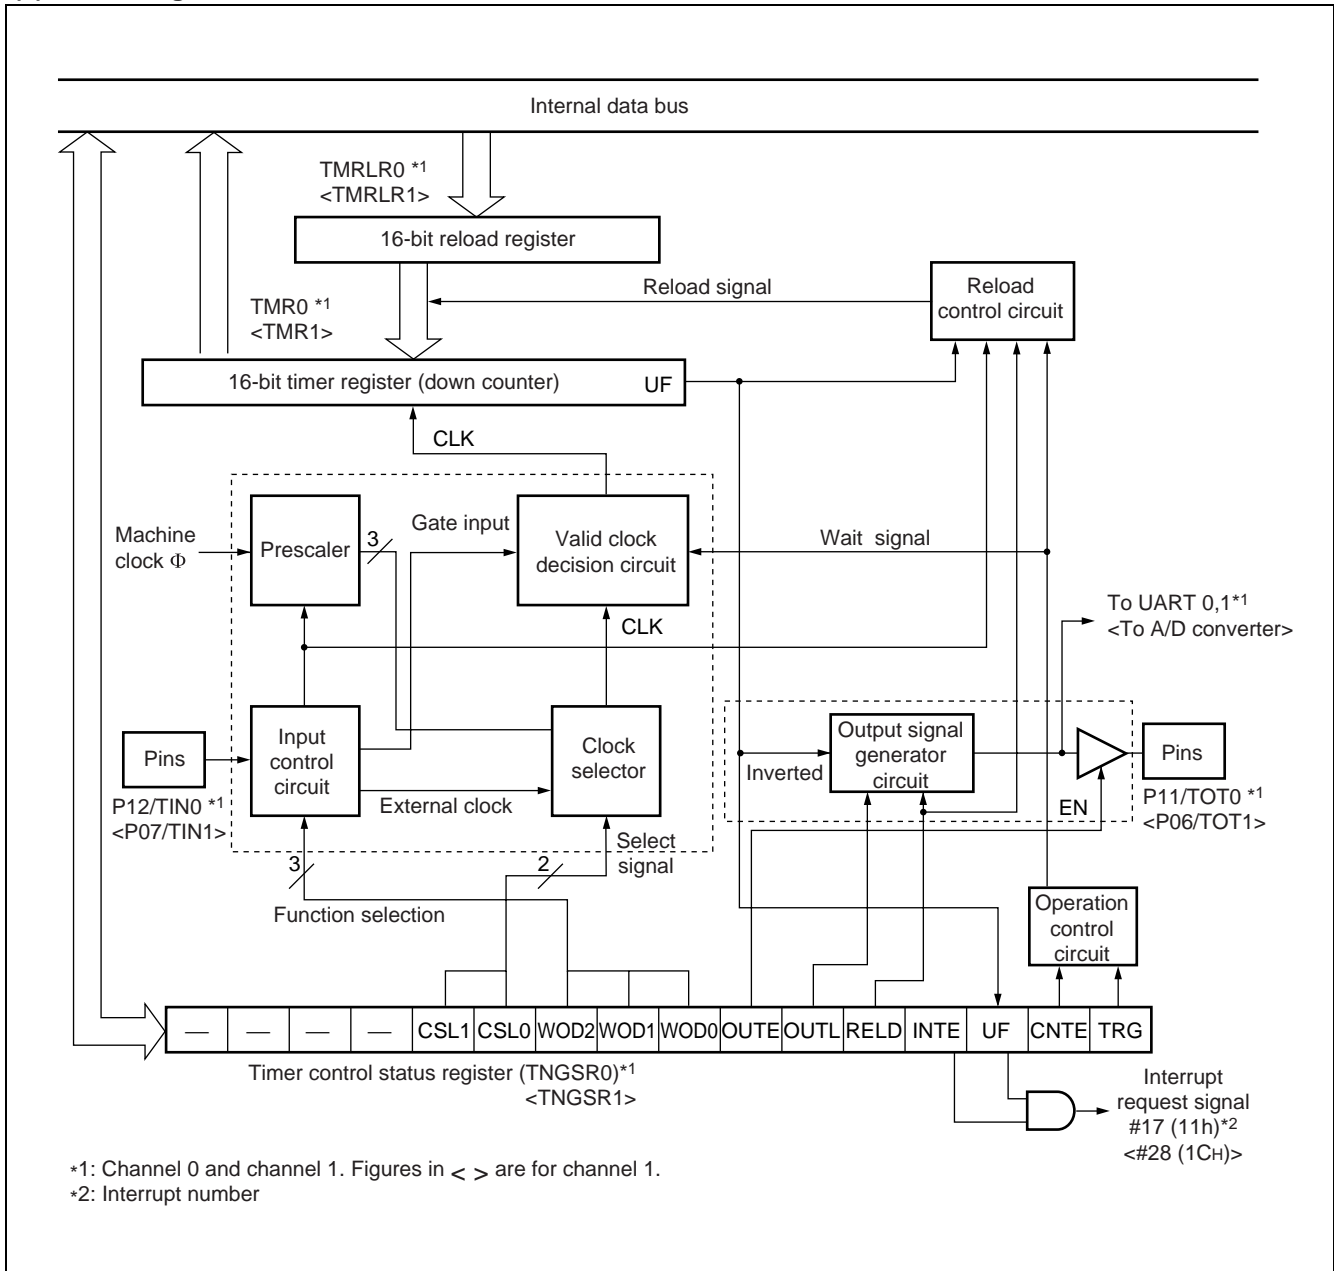

5. Real Time Watch Timer

The real time watch timer is composed of a real time watch timer control register, sub second data register, second/minute/hour data registers, 1/2 clock divider, 21-bit prescaler and second/minute/hour counters. Because the MCU oscillation frequency operates on a given real time watch timer operation, a 4 MHz frequency is assumed. The real time watch timer operates as a real world timer and provides real world time information.

• Block diagram
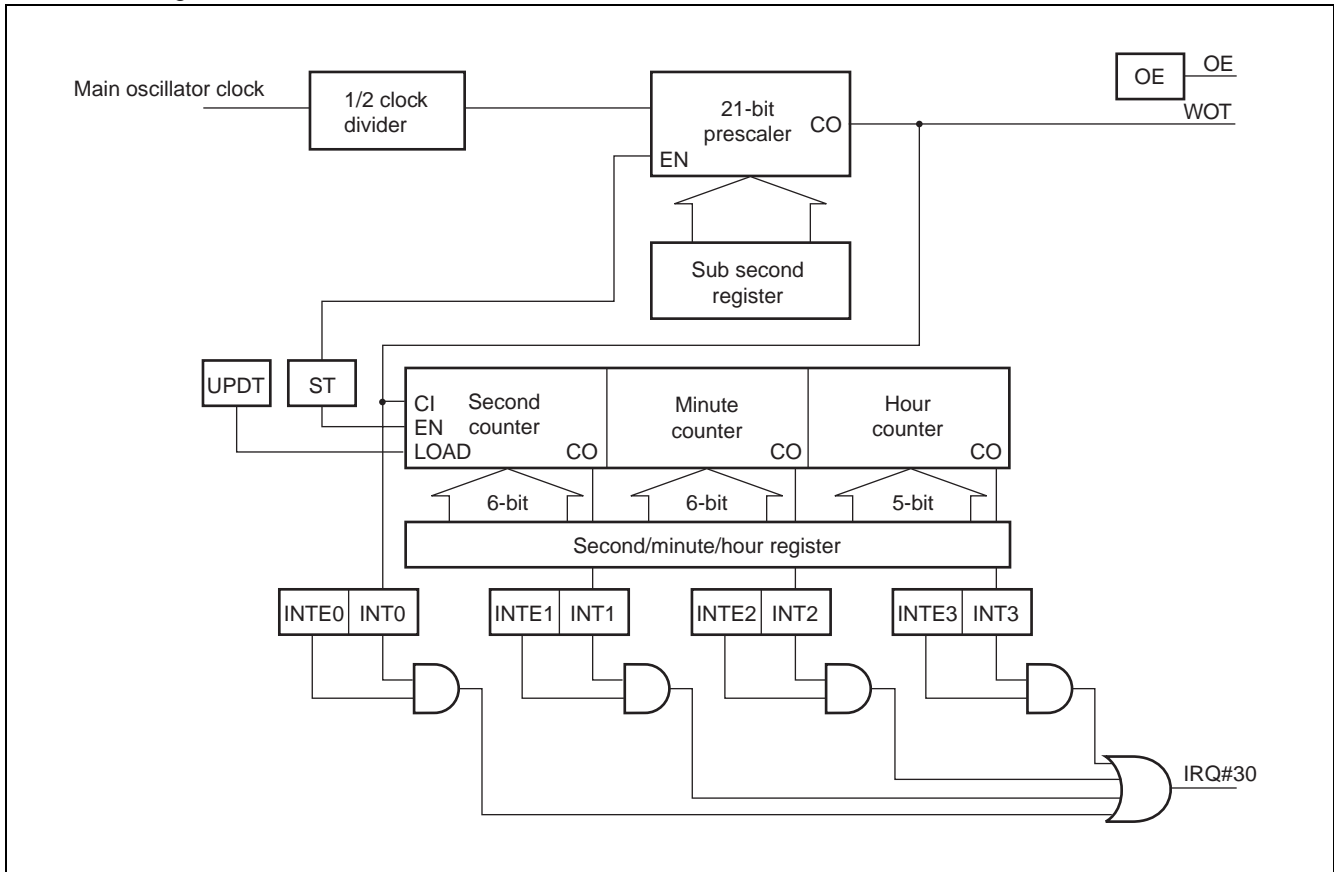

6.   PPG Timer

The PPG timer consists of a prescaler, one 16-bit down-counter, 16-bit data register with buffer for period setting, and 16-bit compare register with buffer for duty setting, plus pin control circuits.

The timer can output pulses synchronized with an externally input soft trigger. The period and duty of the output pulse can be adjusted by rewriting the values in the two 16-bit registers.

(1) PWM function

Programmable to output a pulse, synchronized with a trigger.

Can also be used as a D/A converter with an external circuit.

(2) One-shot function

Detects the edge of a trigger input, and outputs a single pulse.

(3) Pin control
• Set to "1" at a duty match (priority) .
• Reset to "0" at a counter borrow event
• Has a fixed output mode to output a simple all "L" (or "H") signal.
• Polarity can be specified

(4) 16-bit down counter
• Select from four types of counter operation clocks. Four internal clocks (ϕ, ϕ/4, ϕ/16, ϕ/64) ϕ : Machine clock cycles.
• The counter value can be initialized to "FFFF$_H$" at a reset or counter borrow event.

(5) Interrupt requests
• Timer startup
• Counter borrow event (period match)
• Duty match event
• Counter borrow event (period match) or duty match event

(6) Multiple channels can be set to start up at an external trigger, or to restart during operation.

(7) Block diagram
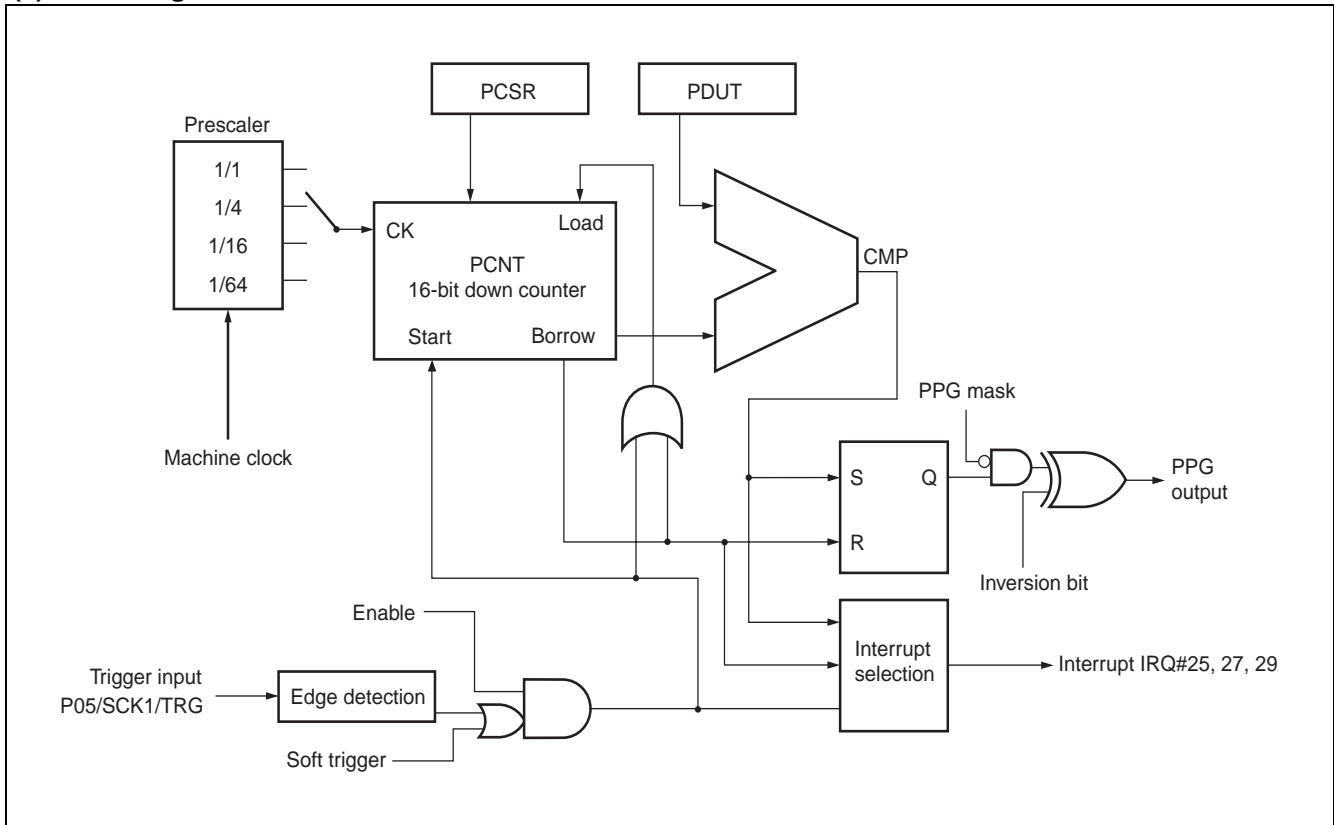

7. Delayed Interrupt Generator Module

The delayed interrupt generator module is a module that generates interrupts for task switching. This module makes it possible to use software to generate/cancel interrupt requests to the F^{2}MC-16LX CPU.

- Block diagram
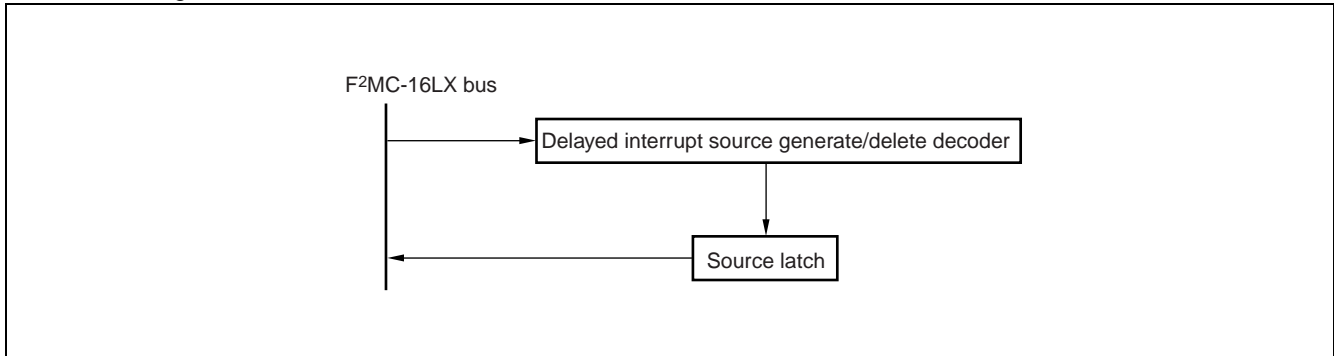

8. DTP/External Interrupt Circuit

The DTP (Data transfer peripheral) /external interrupt circuit is located between an externally connected periph-eral device and the F^{2}MC-16LX CPU and sends interrupt requests or data transfer requests generated from the peripheral device to the CPU, thereby generating external interrupt requests or starting the expanded intelligent I/O services (EI^{2}OS) .

(1) DTP/external interrupt function

The DTP/external interrupt function uses a signal input from the DTP/external interrupt pin as a startup source. And it is accepted by the CPU by the same procedure as a normal hardware interrupt, and can generate an external interrupt or start the expanded intelligent I/O service (EI^{2}OS) .

When the interrupt is accepted by the CPU, if the corresponding expanded intelligent I/O service (EI^{2}OS) is prohibited the interrupt operates as an external interrupt function and branches to an interrupt routine. If the EI^{2}OS is permitted the interrupt functions as a DTP function, using EI^{2}OS for automatic data transfer, then branching to an interrupt routine after the completion of the specified number of data transfers.

	External interrupt	DTP function
Input pins	8 pins (P50/INT0/ADTG to P53/INT3, P00/SIN0/INT4 to P03/INT7)	
Interrupt sources	Request level setting register (ELVR) sets the detection level, or selected edge for each pin	
	"H" level/ "L" level/ rising edge/falling edge input	"H" level/ "L" level input
Interrupt numbers	#16 (10$_H$) , #18 (12$_H$) , #20 (14$_H$) , #22 (16$_H$) , #24 (18$_H$) , #26 (1A$_H$)	
Interrupt control	DTP/interrupt enable register (ENIR) permits/prohibits interrupt request output	
Interrupt flags	DTP/interrupt enable register (EIRR) stores interrupt sources	
Process selection	When EI^{2}OS prohibited (ICR : ISE = 0)	When EI^{2}OS is enabled (ICR : ISE = 1)
Processing	Branch to external interrupt processing routine	EI^{2}OS performs automatic data transfer, then after a specified number of cycles, branches to an interrupt routine

ICR : Interrupt control register

(2) Block diagram
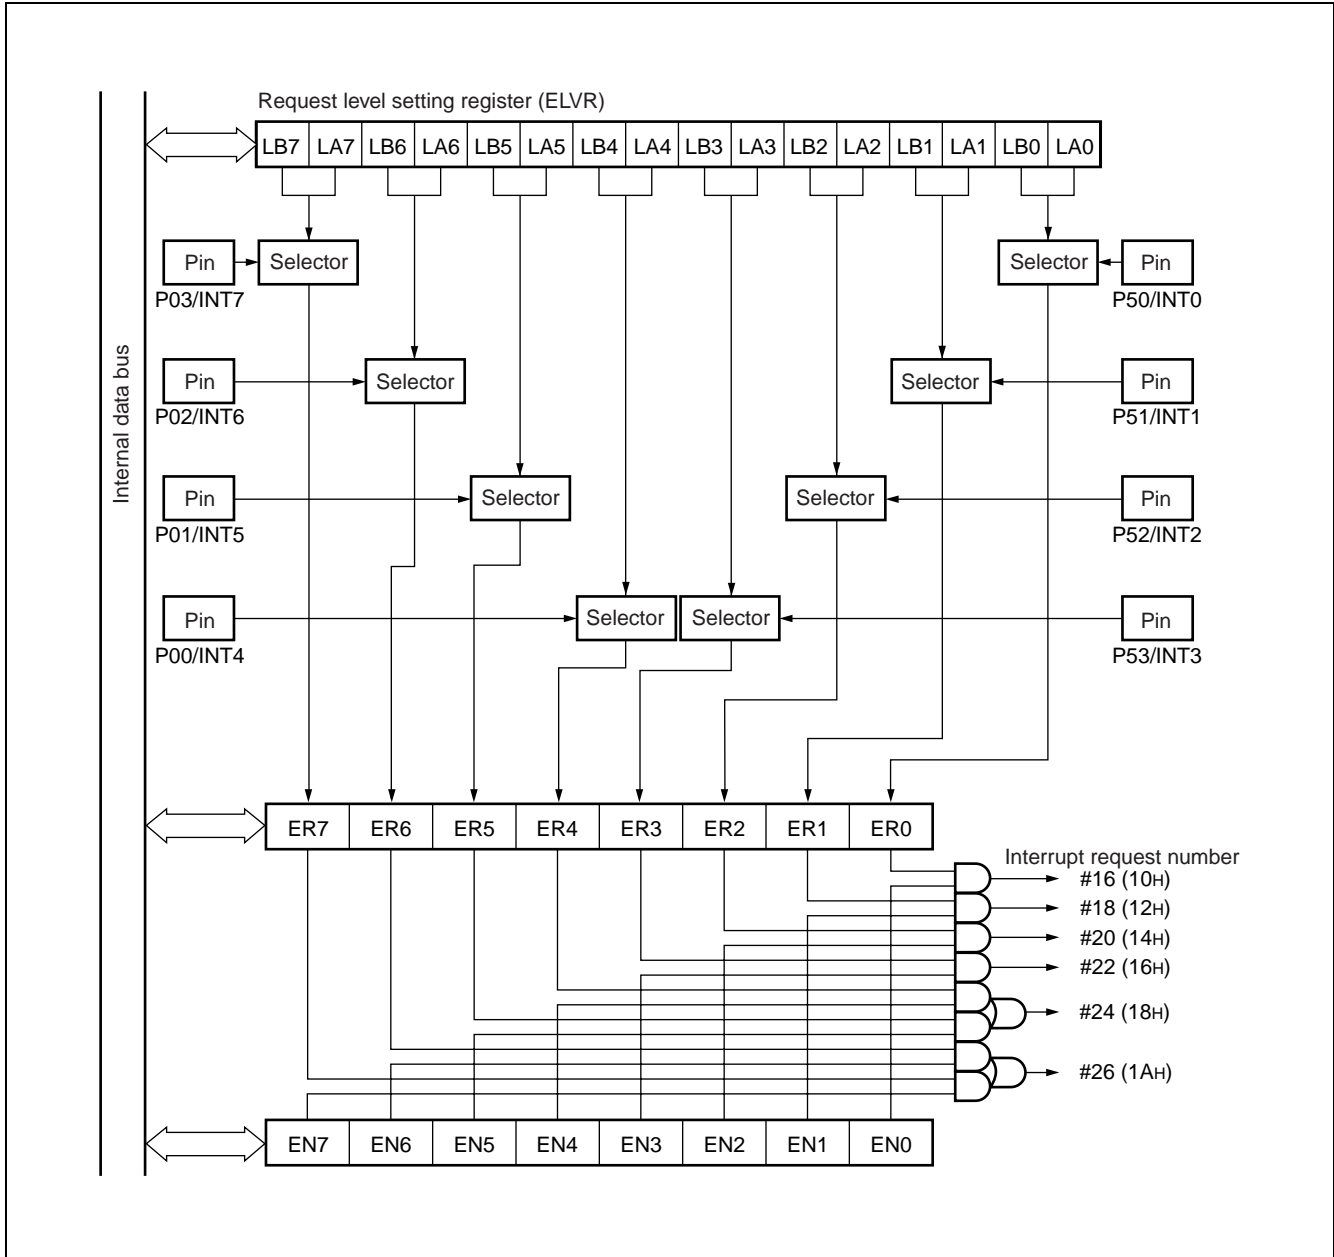

9.   8/10-bit A/D Converter

The 8/10-bit A/D converter has functions for using RC sequential comparator conversion format to convert analog input voltage into 10-bit or 8-bit digital values. The input signal is selected from 8-channel analog input pins, and the conversion start can be selected from three types : by software, 16-bit reload timer 1 or a trigger input from an external signal pin.

(1) 8/10-bit A/D converter functions

The A/D converter takes analog voltage signals (input voltage) input at analog input pins, and converts these to digital values, providing the following features.
• Minimum conversion time is 6.13 μs (at machine clock frequency of 16 MHz, including sampling time) .
• Minimum sampling time is 3.75 μs (at machine clock 16 MHz)
• The conversion method is an RC sequential conversion in comparison with a sample hold circuit.
• Either 10-bit or 8-bit resolution can be selected.
• The analog input pin can select from 8 channels by a program setting.
• At completion of A/D conversion, an interrupt request can be generated, or EI^{2}OS can be started.
• Because the conversion data protection function operates in an interrupt enabled state, no data is lost even in continuous conversion.
• The conversion start source may be selected from : software, 16-bit reload timer 1 (rising edge) , or external trigger input (falling edge) .

Three conversion modes are available

Conversion mode	Single conversion operation	Scan conversion operation
Single conversion mode	Converts the specified channel (1 channel only) one time, then stops.	Converts multiple consecutive channels (up to 8 channels may be specified) one time, then stops.
Continuous conversion mode	Converts the specified channel (1 channel only) repeatedly.	Converts multiple consecutive channels (up to 8 channels may be specified) repeatedly.
Stop conversion mode	Converts the specified channel (1 channel only) one time, then pauses, waits until the next start is applied.	Converts multiple consecutive channels (up to 8 channels may be specified) , however pauses after conversion of each channel, waits until the next start is applied.

(2) Block diagram
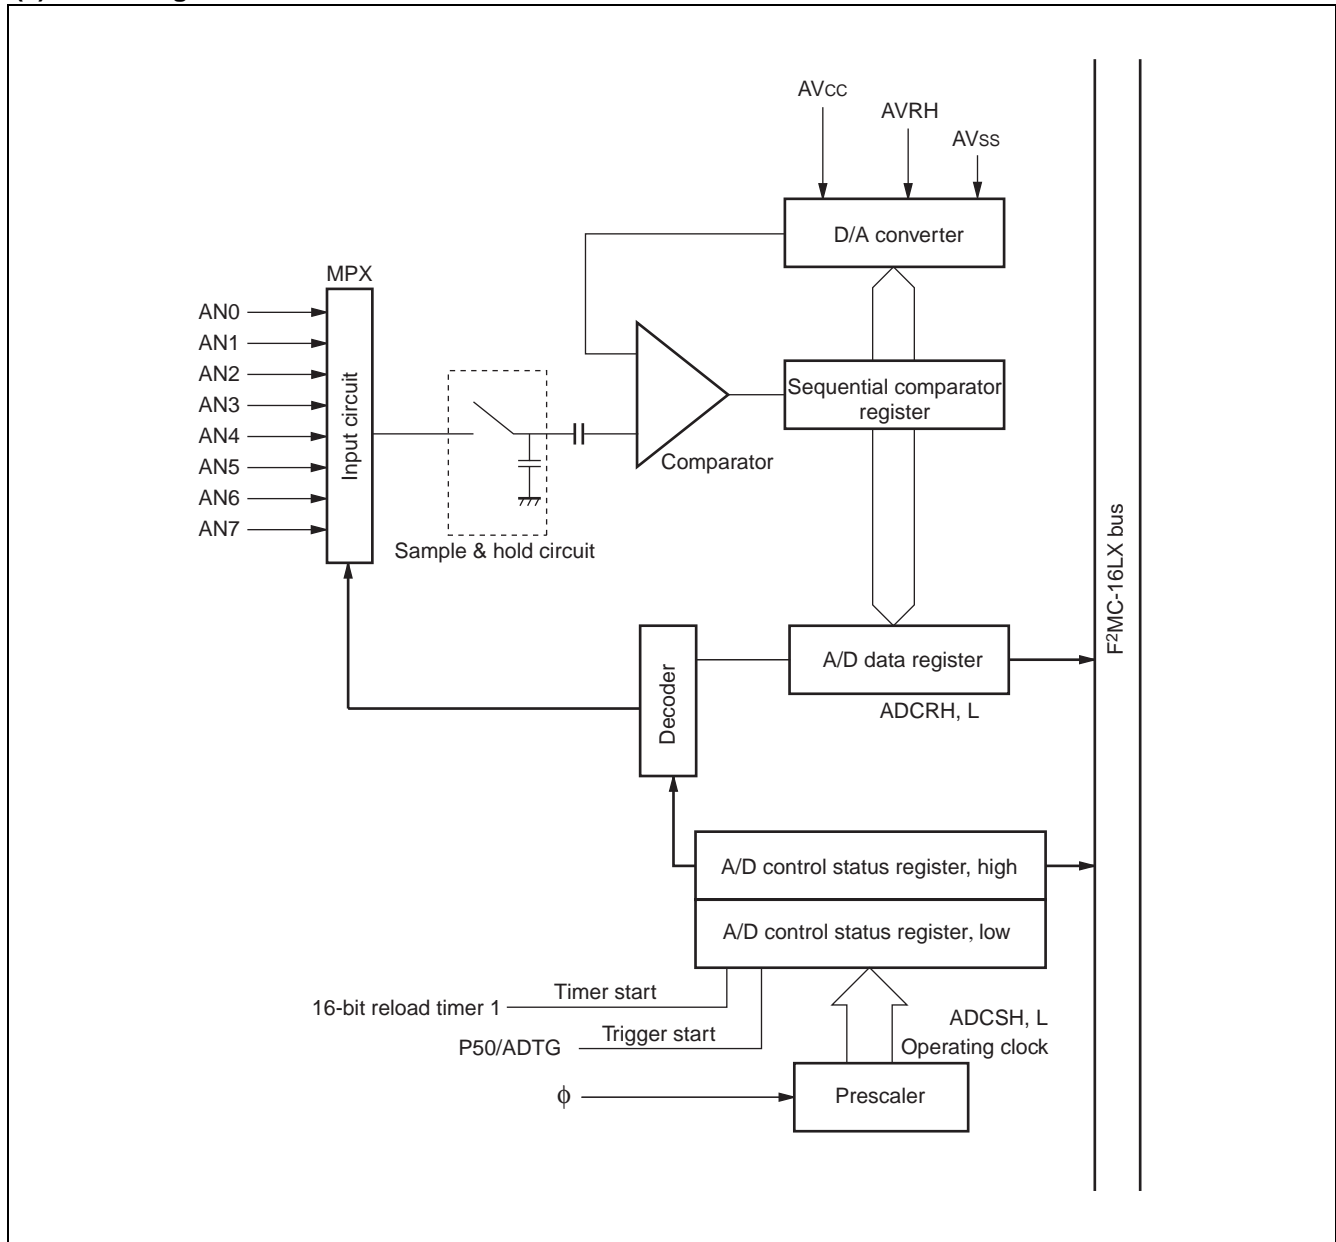

10. UART

The UART is a general purpose serial data communication interface for synchronous communication, or asynchronous (start-stop synchronized) communication with external devices. Functions include normal bi-directional functions, as well as master/slave type communication functions (multi-processor mode : master side only supported) .

(1) UART Functions

The UART is a general purpose serial data communication interface for sending and receiving of serial data with other CPU's or peripheral devices, and provides the following functions.

	Functions
Data buffer	Full duplex double buffer
Transfer modes	• Clock synchronous (no start/stop bits) • Clock asynchronous (start-stop synchronized)
Baud rate	• Exclusive baud rate generator provides a selection of 8 rates • External clock input enabled • Internal clock (can use internal clock feed from 16-bit reload timer)
Data length	• 7-bit (asynchronous normal mode only) • 8-bit
Signal type	NRZ (Non return to zero)
Receiving error detection	• Framing errors • Overrun errors • Parity errors (not enabled in multiprocessor mode)
Interrupt request	• Receiving interrupt (receiving completed, receiving error detection) • Sending interrupt (sending completed) • Sending/receiving both compatible with expanded intelligent I/O services (EI^{2}OS)
Master/slave type communication function (multi-processor mode)	1 (master) -to-n (slave) communication enabled (only master side supported) .

Note : The UART in clock synchronous transfer does not add start bits or stop bits, but transfers data only.

Operating mode		Data length		Synchronization	Stop bit length
		No parity	Parity		
0	Normal mode	7-bit or 8-bit		Asynchronous	1-bit or 2-bit *2
1	Multi-processor mode	8 + 1 *1	—	Asynchronous	
2	Normal mode	8	—	Synchronous	None

— : Setting not available
*1 : "+" indicates an address/data selection bit (A/D) for communication control.
*2 : In receiving only one stop bit is detected.

(2) Block diagram

*: Interrupt number
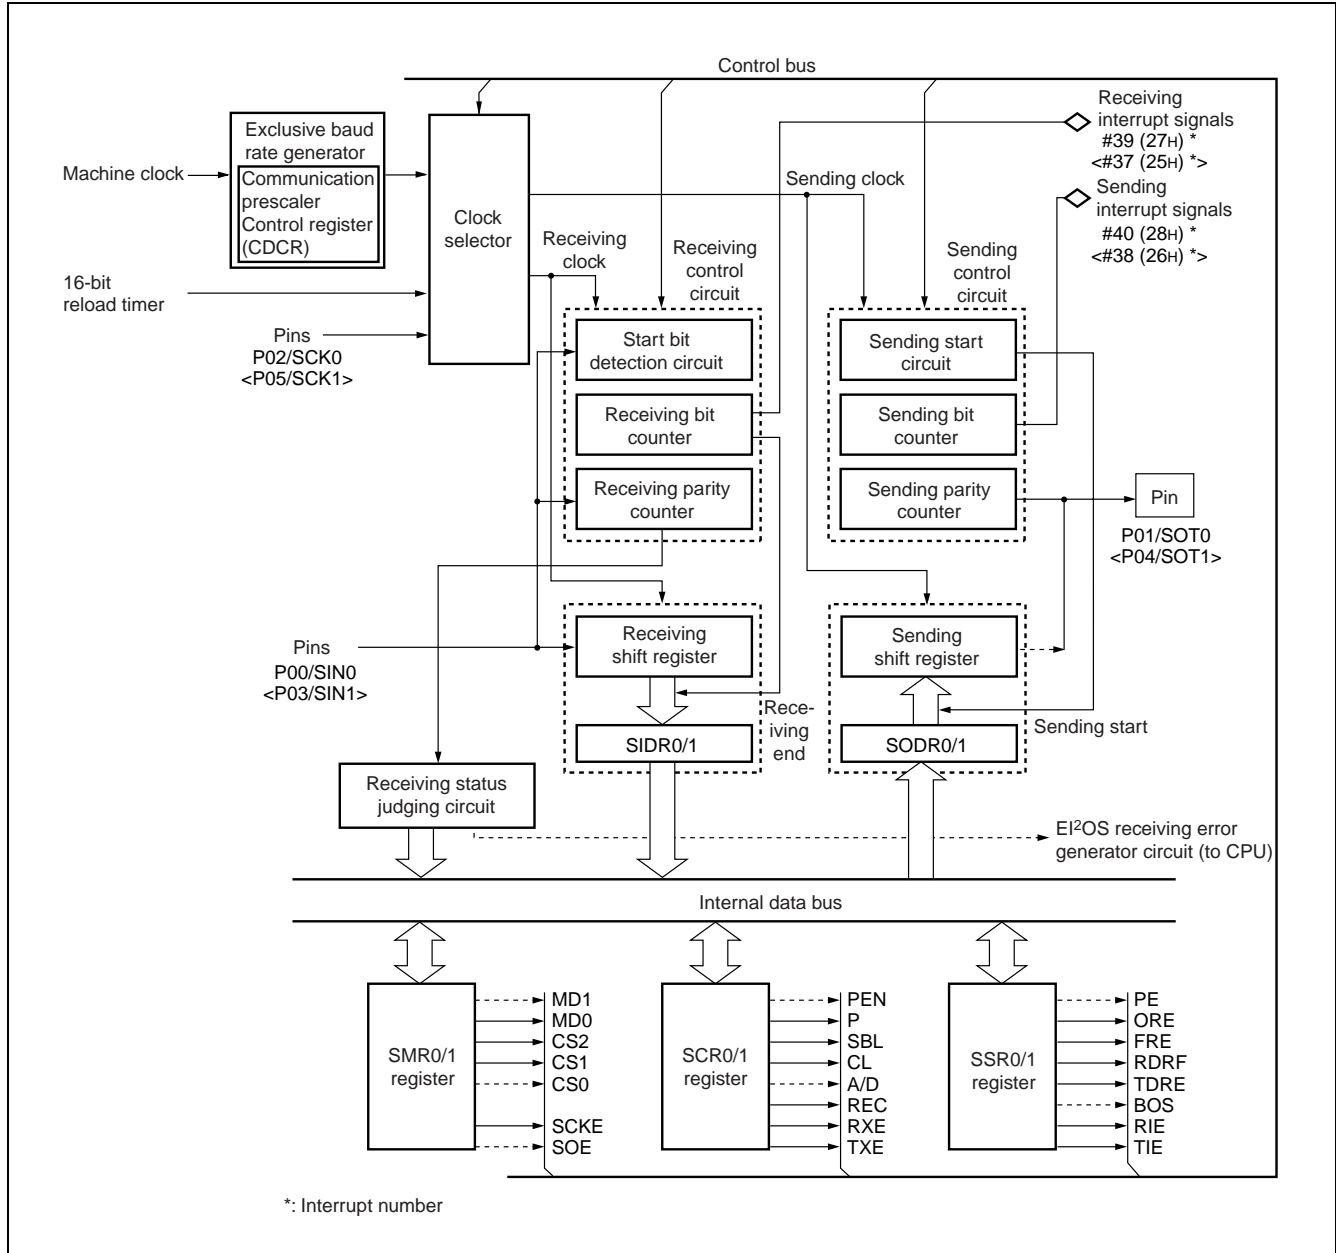

11. CAN Controller

The CAN controller is a self-contained module within a 16-bit microcomputer (F²MC-16LX) . The CAN (controller area network) controller is the standard protocol for serial transmissions among automotive controllers and is widely used in the industry.

(1) CAN controller features

The CAN controller has the following features.
• Conforms to CAN specifications version 2.0 A and B.
 Supports sending and receiving in standard frame and expanded frame format.
• Supports data frame sending by means of remote frame receiving.
• 16 sending/receiving message buffers
 29-bit ID and 8-byte data
 Multi-level message buffer configuration
• Supports full bit compare, full bit mask as well as partial bet mask filtering.
 Provides two receiving mask registers for either standard frame or expanded frame format.
• Bit speed programmable from 10 KB/s to 1 MB/s (at machine clock 16 MHz)
• CAN WAKE UP function
• The MB90420G series has a two-channel built-in CAN controller. The MB90425G series has a 1-channel built-in CAN controller.

(2) Block diagram

FUJITSU
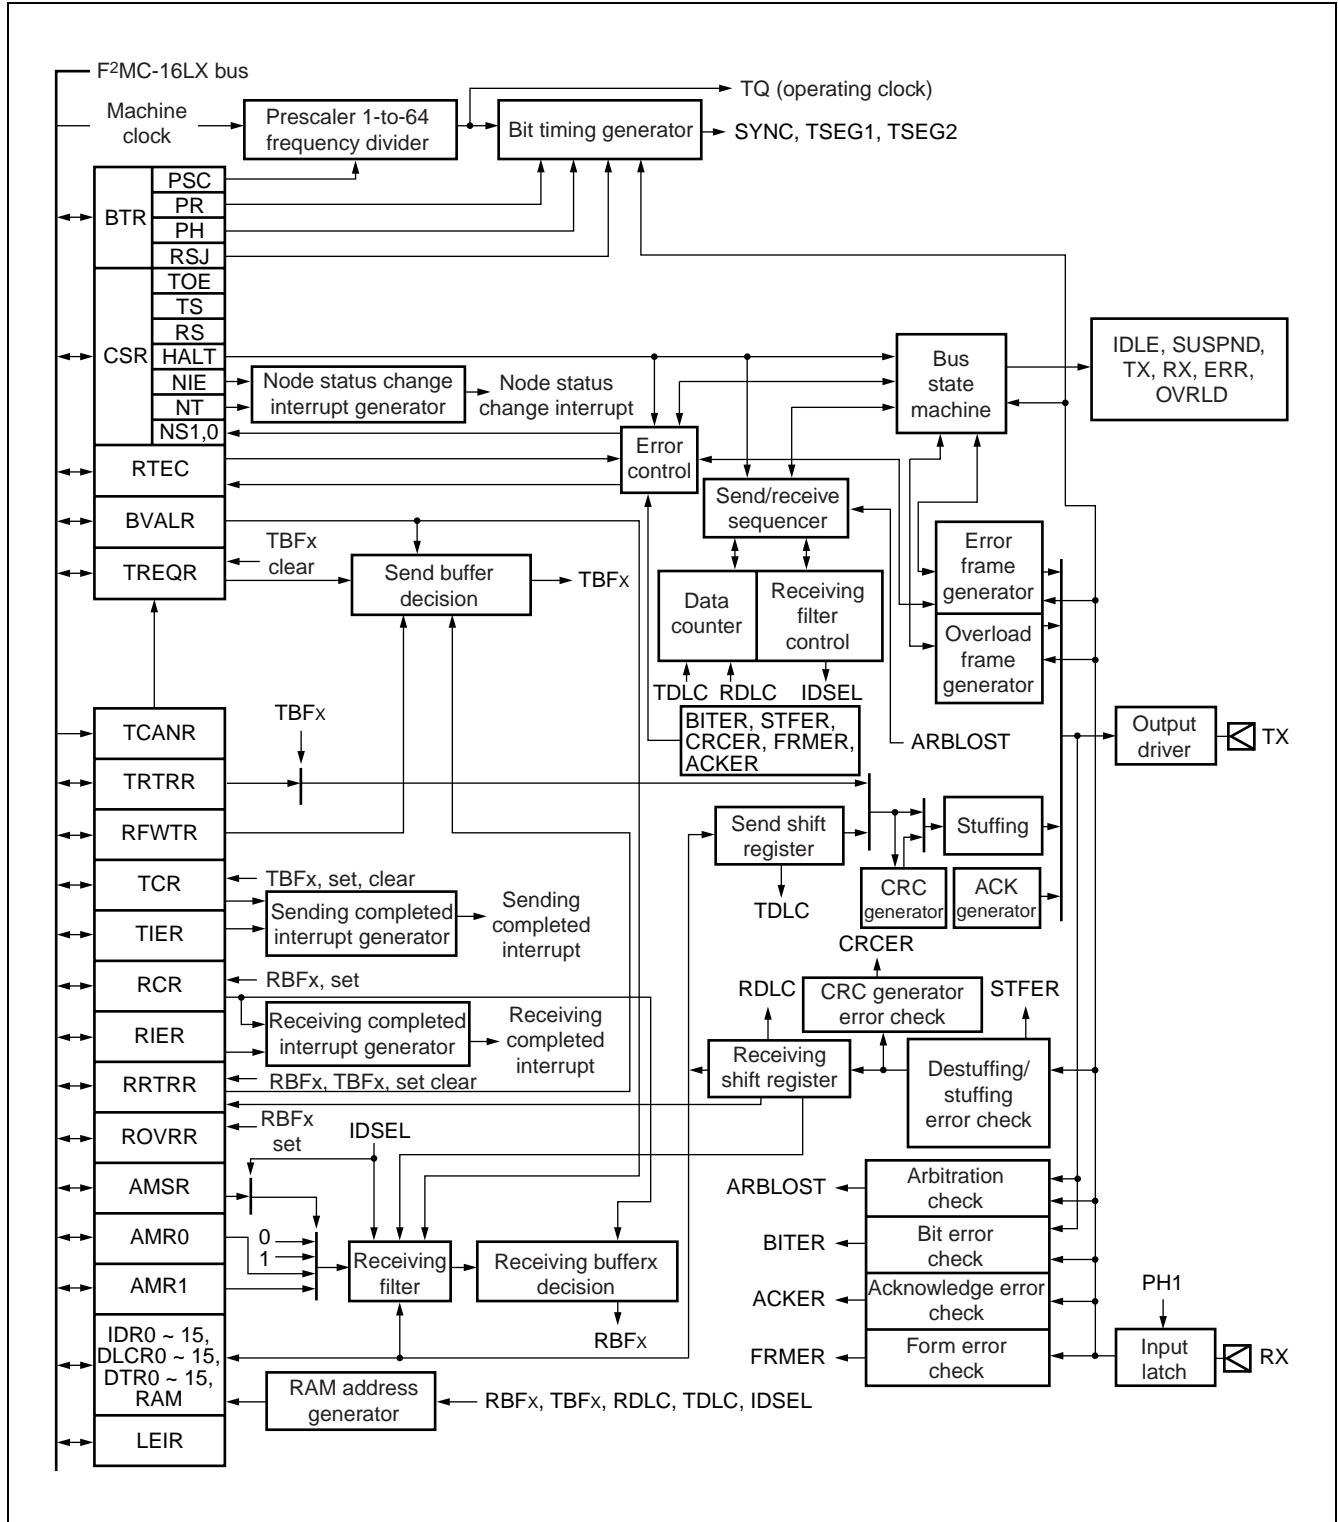

12. LCD Controller/Driver

The LCD controller/driver has a built-in 16 × 8-bit display data memory, and controls the LCD display by means of four common outputs and 24 segment outputs. A selection of three duty outputs are available. This block can drive an LCD (liquid crystal display) panel directly.

(1) LCD controller/driver functions

The LCD controller/driver provides functions for directly displaying the contents of display data memory (display RAM) on the LCD panel by means of segment output and common output.
- LCD drive voltage divider resistance is built-in. External divider resistance can also be connected.
- Up to 4 common outputs (COM0 to COM3) and 24 segment outputs (SEG0 to SEG23) can be used.
- 16-byte display data memory (display RAM) is built-in.
- The duty can be selected at 1/2, 1/3, 1/4 (limited by bias setting) .
- Drives the LCD directly.

Bias	1/2 duty	1/3 duty	1/4 duty
1/2 bias	○	×	×
1/3 bias	×	○	○

○ : Recommended mode
× : Use prohibited

Note : When the SEG12 to SEG23 pins have been selected as general purpose ports by the LCRH setting, they cannot be used for segment output.

(2) Block diagram
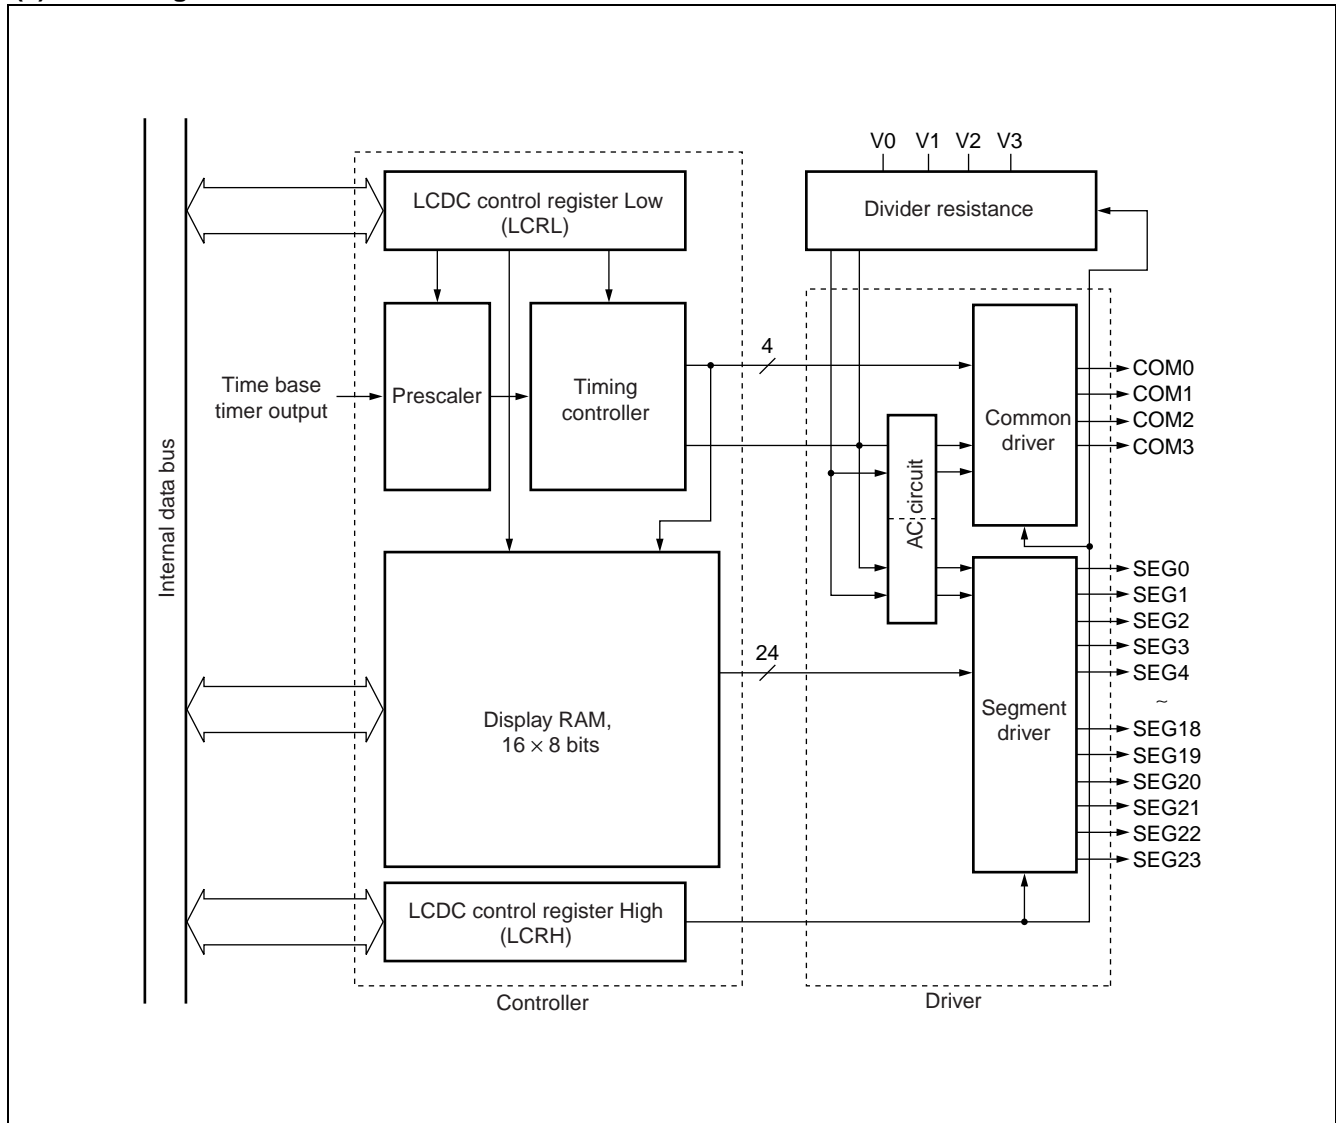

13. Low voltage/Program Looping Detection Reset Circuit

The Low voltage detection reset circuit is a function that monitors power supply voltage in order to detect when a voltage drops below a given voltage level. When a low voltage condition is detected, an internal reset signal is generated.

The Program Looping detection reset circuit is a count clock with a 20-bit counter that generates an internal reset signal if not cleared within a given time after startup.

(1) Low voltage detection reset circuit

Detection voltage
4.0 V $\pm$ 0.3 V

When a low voltage condition is detected, the low voltage detection flag (LVRC : LVRF) is set to "1" and an internal reset signal is output.

Because the low voltage detection circuit continues to operate even in stop mode, detection of a low voltage condition generates an internal reset and releases stop mode.

During an internal RAM write cycle, an internal reset is generated after the completion of writing. During the output of this internal reset, the reset output from the low voltage detection circuit is suppressed.

(2) Program Looping detection reset circuit

The Program Looping detection reset circuit is a counter that prevents program looping. The counter starts automatically after a power-on reset, and must be continually cleared within a given time. If the given time interval elapses and the counter has not been cleared, a cause such as infinite program looping is assumed and an internal reset signal is generated. The internal reset generated form the Program Looping detection circuit has a width of 5 machine cycles.

Interval duration
$2^{20}/F_C$ (Approx. 262 ms *)

* : This value assumes an oscillation clock waveform of 4 MHz.
   During recovery from standby mode the detection period is the maximum interval plus 20 μs.

This circuit does not operate in modes where CPU operation is stopped.

The Program Looping detection reset circuit counter is cleared under any of the following conditions.

1. Writing "0" to the LVRC register CL bit

2. Internal reset

3. Main oscillation clock stop

4. Transition to sleep mode

5. Transition to time base timer mode or watch mode

(3) Block diagram
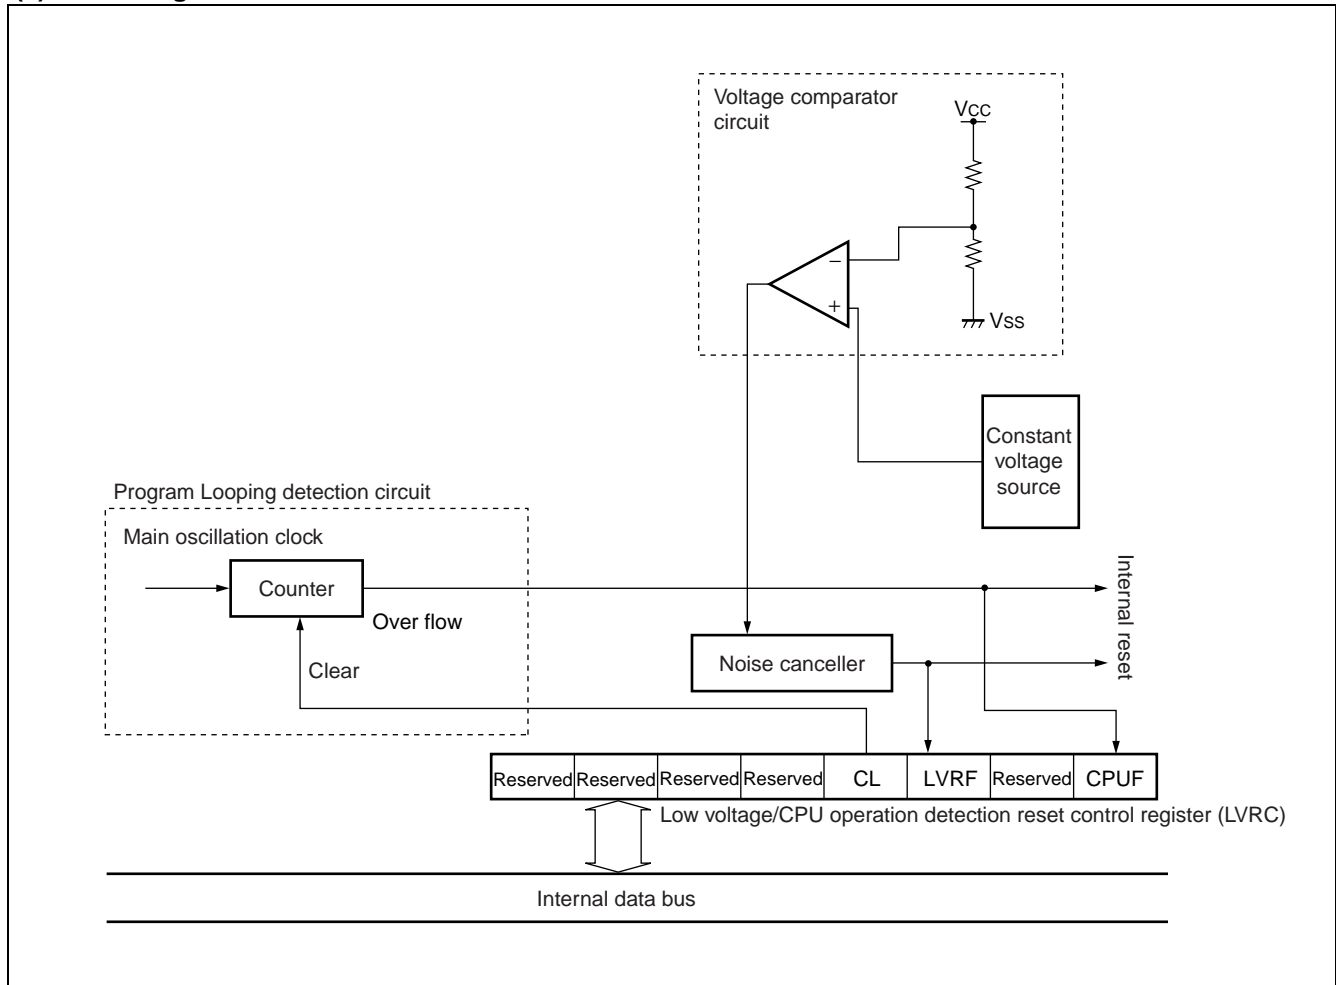

14. Stepping Motor Controller

The stepping motor controller is composed of two PWM pulse generators, four motor drivers and selector logic circuits.

The four motor drivers have a high output drive capacity and can be directly connected to the four ends of two motor coils. They are designed to operate together with the PWM pulse generators and selector logic circuits to control motor rotation. A synchronization mechanism assures synchronization of the two PWM pulse generators.

• Block diagram
15. Sound Generator

The sound generator is composed of a sound control register, frequency data register, amplitude data register, decrement grade register, tone count register, PWM pulse generator, frequency counter, decrement counter, and tone pulse counter.

• Block diagram
16. Address Match Detect Function

If the address setting is the same as the address detection register, an INT9 instruction is executed. The integrated address match detection function can be implemented by processing the INT9 interrupt service routine.

Two address registers are used, each with its own compare enable bit. When there is a match between the address register and program counter, and the compare enable bit is set to "1" , the INT9 instruction is forcibly executed by the CPU.

• Block diagram
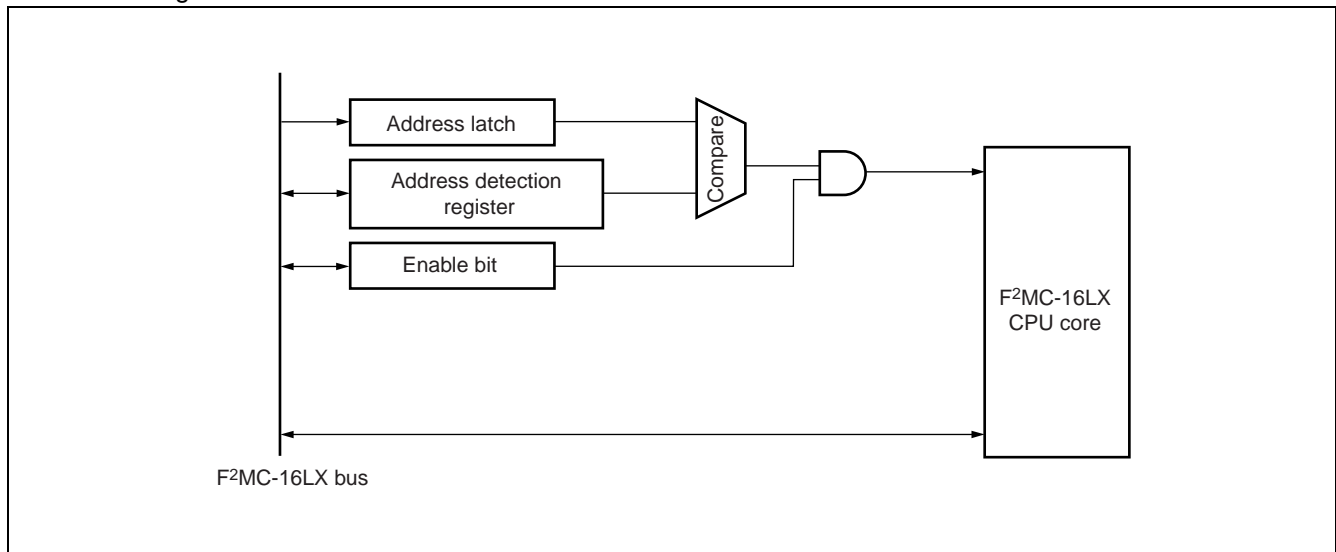

17. ROM Mirror Function Select Module

The ROM mirror function select module uses a select register setting to enable the contents of ROM allocated to the FF bank to be viewed in the 00 bank.

• Block diagram
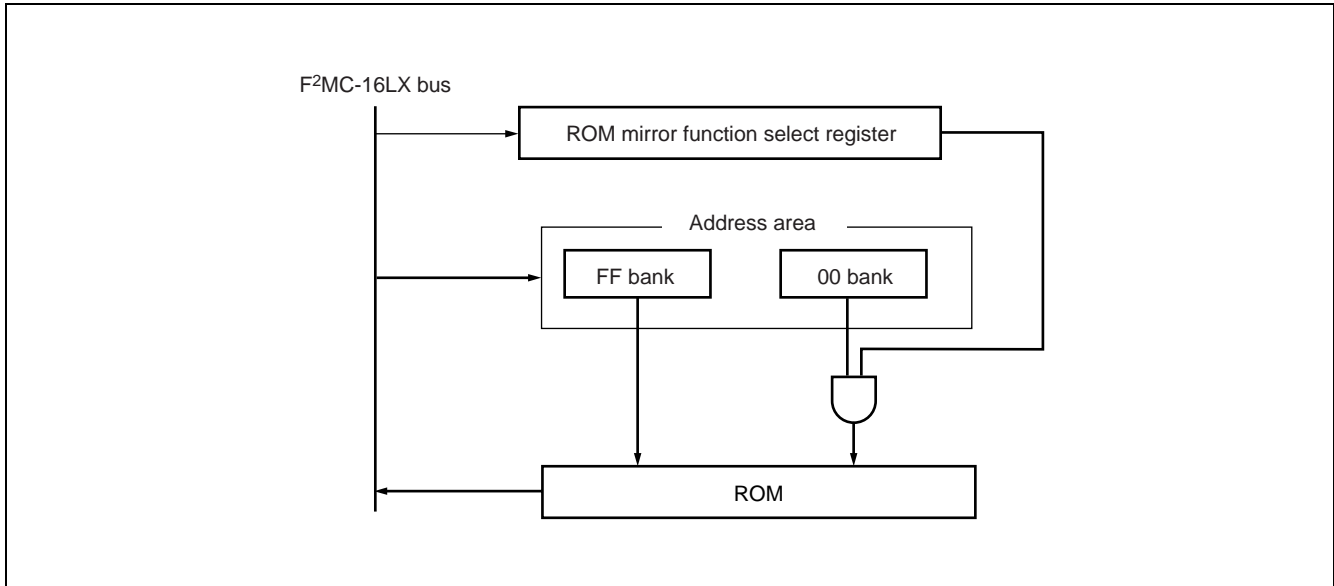

■ ELECTRICAL CHARACTERISTICS

1. Absolute Maximum Ratings

Parameter	Symbol	Rating Min	Rating Max	Unit	Remarks
Power supply voltage*1	V_{CC}	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	
	AV_{CC}	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	$AV_{CC} = V_{CC}$*2
	AVRH	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	$AV_{CC} \geq$ AVRH*2
	DV_{CC}	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	$DV_{CC} = V_{CC}$*2

	ΣI_{OHAV2}*6	—	$- 250$	mA	P70 to P77, P80 to P87
Power consumption	P_D	—	500	mW	
Operating temperature	T_A	$- 40$	$+ 105$	°C	
Storage temperature	T_{STG}	$- 55$	$+ 150$	°C	

*1 : The parameter is based on $V_{SS} = AV_{SS} = DV_{SS} = 0.0$ V.

*2 : AV_{CC}, AVRH and DV_{CC} shall never exceed V_{CC}.
    Also, AVRH shall never exceed AV_{CC}.

*3 : The maximum current to/from and input is limited by some means with extenal components, the I_{CLAMP} rating supersedes the V_I rating.

*4 : Maximum output current is defined as the peak value of the current of any one of the corresponding pins.

*5 : Average output current is defined as the value of the average current flowing over 100 ms at any one of the corresponding pins. The "average value" can be calculated from the formula of "operating current" times "operating factor".

(Continued)

(Continued)

*6 : Average total output current is defined as the value of the average current flowing over 100 ms at all of the corresponding pins. The "average value" can be calculated from the formula of "operating current" times " operating factor".

*7 : • Applicable to pins : P00 to P07, P10 to P15, P50 to P57, P70 to P77, P80 to P87
  • Use within recommended operating conditions.
  • Use at DC voltage (current) .
  • The + B signal should always be applied with a limiting resistance placed between the + B signal and the microcontroller.
  • The value of the limiting resistance should be set so that when the + B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
  • Note that when the microcontroller drive current is low, such as in the power saving modes, the + B input potential may pass through the protective diode and increase the potential at the V_{CC} pin, and this may affect other devices.
  • Note that if a + B signal is input when the microcontroller current is off (not fixed at 0 V) , the power supply is provided from the pins, so that incomplete operation may result.
  • Note that if the + B input is applied during power-on, the power supply is provided from the pins and the resulting supply voltage may not be sufficient to operate the power-on reset.
  • Care must be taken not to leave the + B input pin open.
  • Note that analog system input/output pins (LCD drive pins, comparator input pins, etc.) cannot accept + B signal input.
  • Sample recommended circuits :

  • Input/Output equivalent circuits
WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

2. Recommended Operating Conditions

$$(V_{SS} = DV_{SS} = AV_{SS} = 0.0 \text{ V})$$

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
Power supply voltage	V_{CC} AV_{CC} DV_{CC}	3.7	5.5	V	(MB90F428GA, MB90F423GA, MB90428GA, MB90427GA, MB90423GA) Low voltage detection reset starts to work when power supply voltage is 4.0 V ± 0.3 V.
		3.0	5.5	V	(MB90F428GC, MB90F423GC, MB90428GC, MB90427GC, MB90423GC)

		3.0	5.5	V	Holding stop operation status (MB90F428GC, MB90F423GC, MB90428GC, MB90427GC, MB90423GC)
Smoothing capacitor*	C_S	0.1	1.0	μF	Use a ceramic capacitor or other capacitor of equivalent frequency characteristics. A bypass capacitor on the V_{CC} pin should have a capacitance greater than Cs.
Operating temperature	T_A	− 40	+ 105	°C	

* : For smoothing capacitor Cs connections, see the illustration below.

- C pin connection
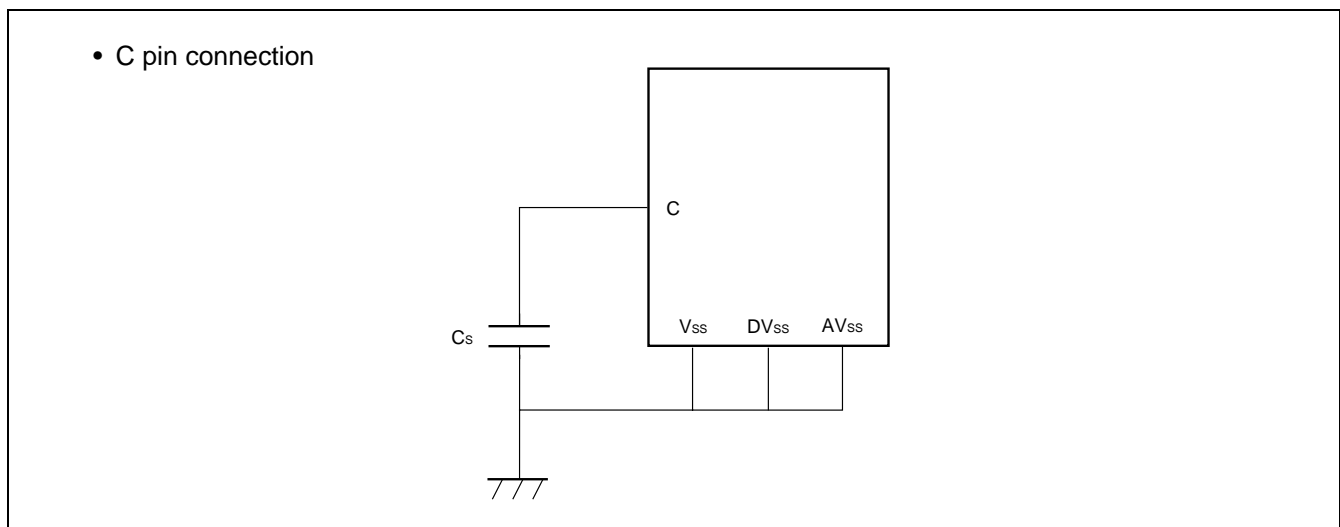

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

- X0 clock timing

- X0A clock timing

FUJITSU
• Range of warranted operation

Relation between internal operating clock frequency and supply voltage
The MB90F428GA, MB90F423GA, MB90428GA, MB90427GA, and MB90423GA
enter reset mode at supply voltage below 4 V ± 0.3 V.

Relation between oscillator clock frequency and internal operating clock frequency

		Internal operating clock frequency				
		Main clock	PLL clock			
			Multiplier ×1	Multiplier ×2	Multiplier ×3	Multiplier ×4
Oscillation clock frequency	4 MHz	2 MHz	—	8 MHz	12 MHz	16 MHz

• Sample oscillator circuit

Oscillator element manufacturer	Oscillator	Frequency	C1	C2
Murata Manufacturing Co., Ltd.	CSTCR4M00G15 ( ) A-R0	4 MHz	39 [pF] (Typ)	39 [pF] (Typ)
AC ratings are defined for the following measurement reference voltage values:
(2) Reset input

(V_{CC} = 5.0 V$\pm$10%, V_{SS} = AV$_{SS}$ = 0.0 V, T_A = $-$ 40 °C to $+$ 105 °C)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	**Max**		
Reset input time	t_{RSTL}	$\overline{RST}$	—	16 t_{CP}	—	ns	In normal operation
				Oscillator oscillation time* + 16 t_{CP}	—	ms	In stop mode, sub clock mode, sub sleep mode, watch mode

*: Oscillator oscillation time is the time to reach 90% amplitude. For a crystal oscillator, this is a few to several hundred ms; for a FAR/ceramic oscillator, this is several hundred ms to a few ms, and for an external clock this is 100 µs.

Note : t_{CP} : See " (1) Clock input timing".

- Under normal operation
- In stop mode, sub clock mode, sub sleep mode, watch mode

FUJITSU
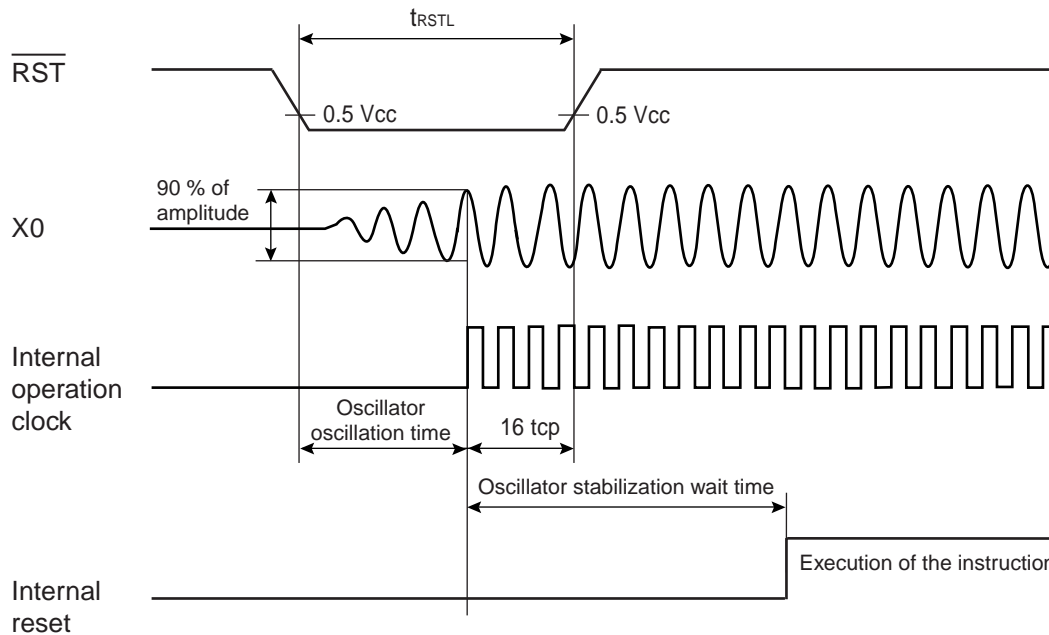

(3) Power-on reset, power on conditions

$(V_{SS} = 0.0 \text{ V}, T_A = 40 °C \text{ to } + 105 °C)$

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Power supply rise time	t_R	V_{CC}	—	0.05	30	ms	
Power supply start voltage	V_{OFF}			—	0.2	V	
Power supply attained voltage	V_{ON}			2.7	—	V	
Power supply cutoff time	t_{OFF}			50	—	ms	For repeat operation
Extreme variations in voltage supply may activate a power-on reset.
As the illustration below shows, when varying supply voltage during operation the use of a smooth voltage rise with suppressed fluctuation is recommended. Also in this situation, the PLL clock on the device should not be used, however it is permissible to use the PLL clock during a voltage drop of 1V/s or less.
(4) UART0, UART1 timing

$(V_{CC} = 5.0\ V\pm10\%,\ V_{SS} = AV_{SS} = 0.0\ V,\ T_A = -40\ °C\ to\ +105\ °C)$

Parameter	Symbol	Pin name	Conditions	Value Min	Value Max	Unit	Remarks
Serial clock cycle time	t_{SCYC}	SCK0, SCK1	—	8 t_{CP}	—	ns	Internal shift clock mode output pin C_L = 80 pF + 1•TTL
SCK fall to SOT delay time	t_{SLOV}	SCK0, SCK1 SOT0, SOT1		− 80	80	ns	
Valid SIN to SCK rise	t_{IVSH}	SCK0, SCK1 SIN0, SIN1		100	—	ns	
SCK rise to valid SIN hold time	t_{SHIX}			60	—	ns	
Serial clock "H" pulse width	t_{SHSL}	SCK0, SCK1		4 t_{CP}	—	ns	External shift clock mode output pin C_L = 80 pF + 1•TTL
Serial clock "L" pulse width	t_{SLSH}			4 t_{CP}	—	ns	
SCK fall to SOT delay time	t_{SLOV}	SCK0, SCK1 SOT0, SOT1	—	—	150	ns	
Valid SIN to SCK rise	t_{IVSH}	SCK0, SCK1 SIN0, SIN1		60	—	ns	
SCK rise to valid SIN hold time	t_{SHIX}			60	—	ns	

Notes : • AC ratings are for CLK synchronous mode.
• C_L is load capacitance connected to pin during testing.
• t_{CP} : See " (1) Clock timing".

• Internal shift clock mode

SCK / SOT / SIN ... t_{SCYC}, 2.4 V, 0.8 V, t_{SLOV}, 2.4 V, 0.8 V, t_{IVSH}, t_{SHIX}, 0.8 V_{CC}, 0.5 V_{CC}

• External shift clock mode

SCK / SOT / SIN ... t_{SLSH}, t_{SHSL}, 0.8 V_{CC}, 0.5 V_{CC}, t_{SLOV}, 2.4 V, 0.8 V, t_{IVSH}, t_{SHIX}, 0.8 V_{CC}, 0.5 V_{CC}
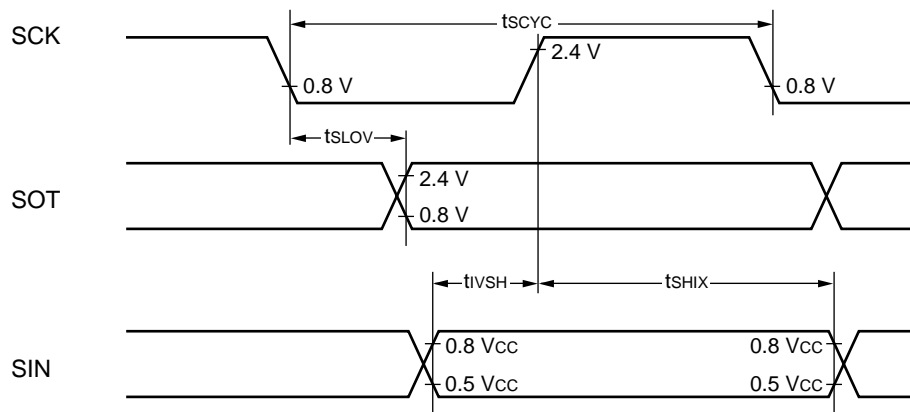

(5) Timer input timing

(V$_{CC}$ = 5.0 V±10%, V$_{SS}$ = AV$_{SS}$ = 0.0 V, T$_A$ = − 40 °C to + 105 °C)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Input pulse width	t$_{TIWH}$ t$_{TIWL}$	TIN0, TIN1, IN0, IN1, IN2, IN3,	—	4 t$_{CP}$	—	ns	

Note : t$_{CP}$: See " (1) Clock timing".

• Timer input timing
(6) Trigger input timing

(V$_{CC}$ = 5.0 V±10%, V$_{SS}$ = AV$_{SS}$ = 0.0 V, T$_A$ = − 40 °C to + 105 °C)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Input pulse width	t$_{TRGH}$, t$_{TRGL}$	INT0 to INT7	—	5 t$_{CP}$	—	ns	Under normal operation
				1	—	μs	In stop mode

Note : t$_{CP}$: See " (1) Clock timing".

• Trigger input timing
(7) Low voltage detection

$(V_{SS} = AV_{SS} = 0.0 \text{ V}, T_A = -40 \text{ °C to } +105 \text{ °C})$

Parameter	Symbol	Pin name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Detection voltage	V_{DL}	V_{CC}	—	3.7	4.0	4.3	V	During voltage drop
Hysteresis width	V_{HYS}	V_{CC}	—	0.1	—	—	V	During voltage rise
Power supply voltage fluctuation ratio	dV/dt	V_{CC}	—	-0.1	—	0.02	V/μs	
Detection delay time	t_d	—	—	—	—	35	μs	

FUJITSU
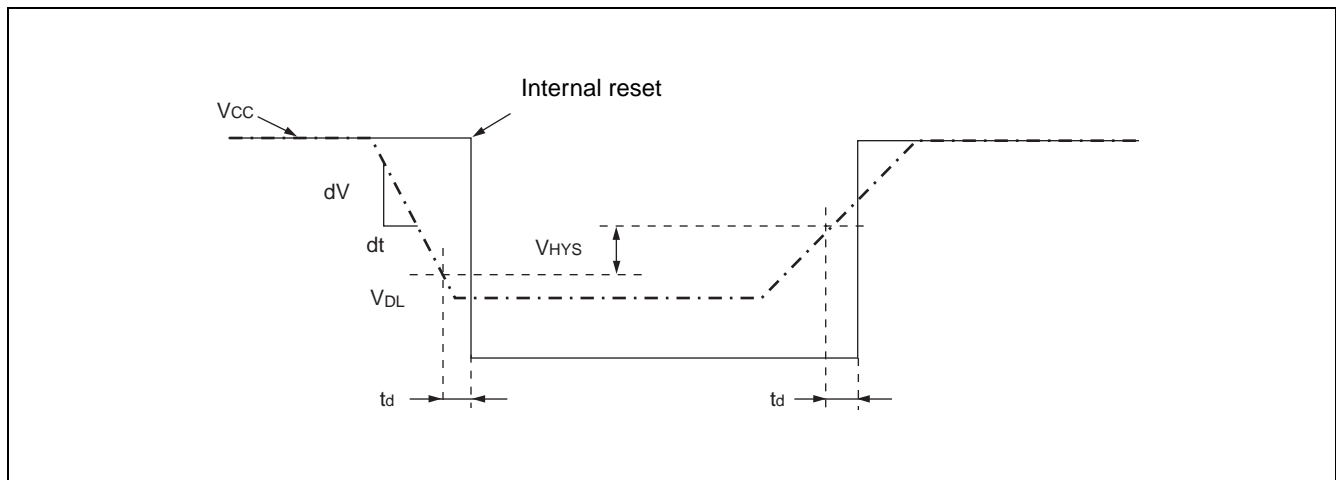

5. A/D Conversion Block

(1) Electrical Characteristics

$(V_{CC} = AV_{CC} = 5.0 \text{ V} \pm 10\%, V_{SS} = AV_{SS} = 0.0 \text{ V}, T_A = -40 \text{ °C to} + 105 \text{ °C})$

Parameter	Symbol	Pin name	Value			Unit	Remarks
			Min	Typ	Max		
Resolution	—	—	—	—	10	bit	
Total error	—	—	—	—	±5.0	LSB	
Non-linear error	—	—	—	—	±2.5	LSB	
Differential linear error	—	—	—	—	±1.9	LSB	
Zero transition voltage	V_{OT}	AN0 to AN7	AV_{SS} − 3.5 LSB	AV_{SS} + 0.5 LSB	AV_{SS} + 4.5 LSB	V	1 LSB = $(AVRH - AV_{SS})$ / 1024
Full scale transition voltage	V_{FST}	AN0 to AN7	AVRH − 6.5 LSB	AVRH − 1.5 LSB	AVRH + 1.5 LSB	V	
Sampling time	t_{SMP}	—	2.000	—	—	μs	*1
Compare time	t_{CMP}	—	4.125	—	—	μs	*2
A/D conversion time	t_{CNV}	—	6.125	—	—	μs	*3
Analog port input current	I_{AIN}	AN0 to AN7	—	—	10	μA	$V_{AVSS} = V_{AIN} = V_{AVCC}$
Analog input current	V_{AIN}	AN0 to AN7	0	—	AVRH	V	
Reference voltage	AVR+	AVRH	3.0	—	AV_{CC}	V	
Power supply current	I_A	AV_{CC}	—	2.3	6.0	mA	
	I_{AH}		—	—	5	μA	*4
Reference voltage feed current	I_R	AVRH	50	180	260	μA	$V_{AVRH} = 5.0 \text{ V}$
	I_{RH}	AVRH	—	—	5	μA	*4
Inter-channel variation	—	AN0 to AN7	—	—	4	LSB	

*1 : At $F_{CP} = 16$ MHz, $t_{SMP} = 32 \times t_{CP} = 2.000$ (μs) .

*2 : At $F_{CP} = 16$ MHz, $t_{CMP} = 66 \times t_{CP} = 4.125$ (μs) .

*3 : Equivalent to conversion time per channel at $F_{CP} = 16$ MHz, and selection of $t_{SMP} = 32 \times t_{CP}$ and $t_{CMP} = 66 \times t_{CP}$.

*4 : Defined as supply current (when $V_{CC} = AV_{CC} = AVRH = 5.0$ V) with A/D converter not operating, and CPU in stop mode.

• **Notes of the external impedance of the analog input and its sampling time**
• A/D converter with sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting A/D conversion presicion.

• Analog input circuit model

	R	C
MB90420GA/420GC	2.4 kΩ (Max)	36.4 pF (Max)
MB90F420GA/F420GC	2.6 kΩ (Max)	28.0 pF (Max)
MB90V420G	3.2 kΩ (Max)	30.0 pF (Max)
Note : The values are reference values.

• To satisfy the A/D conversion precision standard, consider the relationship between the external impedance and minimum sampling time and either adjust the resistor value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value.

• The relationship between the external impedance and minimum sampling time
• If the sampling time cannot be sufficient, connect a capacitor of about 0.1 μF to the analog input pin.

• About errors
As |AVRH| becomes smaller, values of relative errors grow larger.

(2) Definition of terms
- Resolution
  Indicates the ability of the A/D converter to discriminate in analog conversion.
  10-bit resolution indicates that analog voltage can be resolved into $2^{10} = 1024$ levels.
- Total error
  Expresses the difference between actual and logical values. It is the total value of errors that can come from offset error, gain error, non-linearity error and noise.
- Linearity error
  Expresses the deviation between actual conversion characteristics and a straight line connecting the device's zero transition point (00 0000 0000 $\leftarrow\rightarrow$ 00 0000 0001) and full scale transition point (11 1111 1110 $\leftarrow\rightarrow$ 11 1111 1111) .
- Differential linearity error
  Expresses the deviation of the logical value of input voltage required to create a variation of 1 LSB in output code.

- 10-bit A/D converter conversion characteristics

Digital output (vertical axis):

$1\ LSB \times N + V_{OT}$

Linearity error

Analog input (horizontal axis): V_{OT} ... V_{NT} $V_{(N+1)T}$ ... V_{FST}
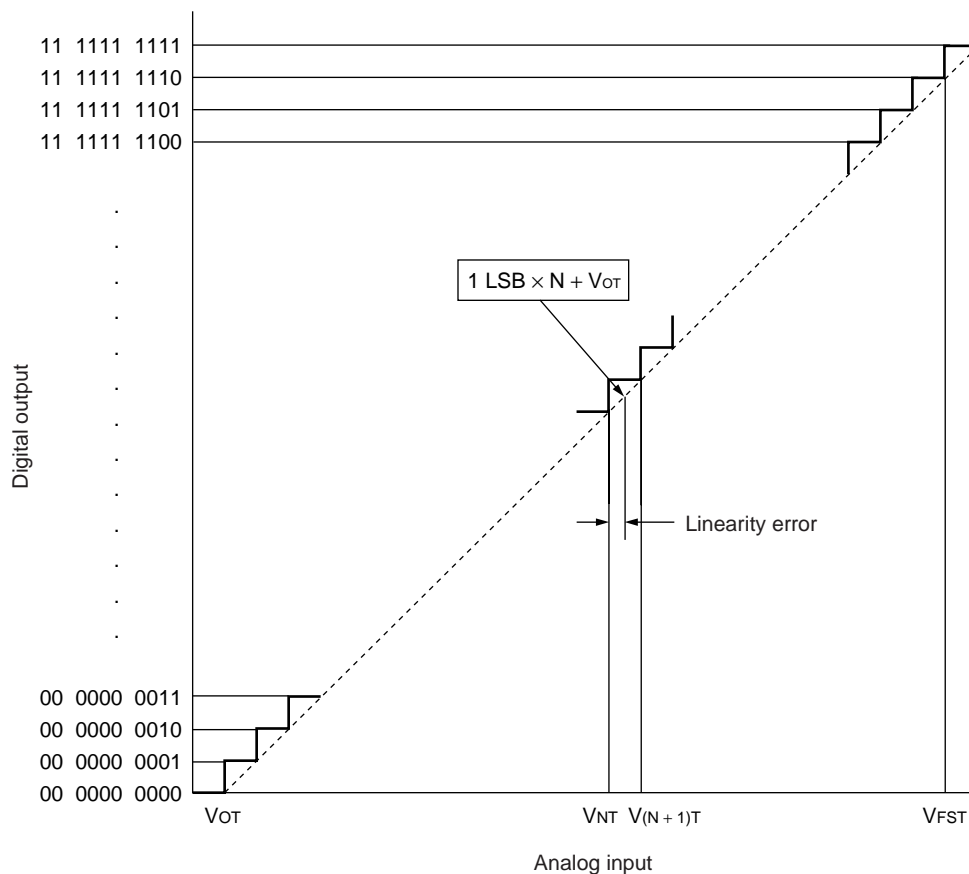

$$1\ LSB = \frac{V_{FST} - V_{OT}}{1022}$$

$$\text{Linearity error} = \frac{V_{NT} - (1\ LSB \times N + V_{OT})}{1\ LSB}\ [LSB]$$

$$\text{Differential linearity error} = \frac{V_{(N+1)T} - V_{NT}}{1\ LSB} - 1\ [LSB]$$

6. Flash Memory Program and Erase Performances

Parameter	Conditions	Value			Unit	Remarks
		Min	Typ	Max		
Sector erase time	$T_A = + 25\ °C$ $V_{CC} = 5.0\ V$	—	1	15	s	Excludes 00_H programming prior erasure
Chip erase time		—	5	—	s	Excludes 00_H programming prior erasure
Word (16 bit width) programming time		—	16	3,600	µs	Excludes system-level overhead
Erase/Program cycle	—	10,000	—	—	cycle	
Flash data retention time	Average $T_A = + 85\ °C$	10	—	—	year	*

* : This value comes from the technology qualification. (using Arrhenius equation to translate high temperature measurements into normalized value at + 85 °C)

■ EXAMPLE CHARACTERISTICS

$I_{CC} - V_{CC}$ ($T_A = +\ 25\ °C$)

$I_{CTS} - V_{CC}$ ($T_A = +\ 25\ °C$)

$I_{CCL} - V_{CC}$ ($F_C = 8$ kHz)

I_{CCLS} – V_{CC} (F$_C$ = 8 kHz)

I_{CCT} – V_{CC} (F$_C$ = 8 kHz)
